Regardless of the application – for our customers product quality and profitability are what matters. This is what GEA Flow Components is known for. Our engineers are specialists in everything that flows.

GEA Group Aktiengesellschaft

GEA is one of the largest suppliers of process technology for the food industry and for a wide range of other industries. As an international technology group, the company focuses on world-leading process solutions and components for sophisticated production processes.

GEA Flow Components

GEA offers well-engineered process components and services to ensure smooth production processes in the treatment of liquid products. We develop and produce a comprehensive product range that includes valve technology for all hygienic classes (Hygienic, UltraClean, Aseptic), hygienic pumps and cleaning technology.

GEA Flow Components products and services are available around the world through the international GEA network.

Around one quarter of the milk processed is handled by GEA equipment

Roughly every second liter of beer is brewed using GEA equipment and solutions

Approx. one in three instant coffee lines has been built by GEA

State-of-the-art hygienic design

GEA Flow Components meet the highest hygienic standards where required, such as EHEDG and 3-A standards.

Hygienic valves and components from GEA form the core component of matrix-piped process plants.

When it comes to sterile applications, GEA offers both UltraClean and Aseptic valves and systems. The hermetic sealing of the product area provides a maximum level of process line isolation and thus contributes to process and product safety.

The hygienic pump range from GEA includes centrifugal pumps (single-stage, multi-stage and self-priming), as well as rotary lobe pumps.

GEA cleaning devices – whether index, orbital, rotary or static – achieve optimum cleaning results in multiple industries. GEA product recovery systems help to recover valuable products and reduce both waste disposal costs as well as water and detergent consumption.

Applications

- Beverage
 - Beer, juice, smoothie products ...
- Dairy
 - Milk, yoghurt, cheese ...
- Food
 - Sauces & cremes, ketchup, mayonnaise ...
- Pharma/Biotech
 - Pharmaceuticals, biotechnology products, cosmetics & health care ...
- Chemicals
 - Fine chemicals, bulk chemicals, cleaning chemicals ...
- Dairy farming
 - Raw milk processing ...

Hygienic Valve Technology

A complete range of economically designed Hygienic valves for complex tasks as well as basic functions, helping producers to achieve high product quality and efficiency.

Aseptic Valve Technology

UltraClean and Aseptic valves are suitable for production processes which require a higher safety protection against contamination from the environment and thus warrant microbial stability of the product over the whole process.

Hygienic Pump Technology

A great variety of Hygienic pumps with sensibly rated high efficiency motors and carefully designed flow paths, driving economic efficiency and sustainable operation.

Cleaning Technology

Index, orbital, rotating and static cleaners in a complete range, developed with special emphasis on saving valuable resources in the cleaning process.

The components of GEA Tuchenhausen are based on future-oriented company and product concept principles that include an obligation to economic viability, sustainability and service.

Your investment pays off

GEA Tuchenhausen hygienic valves and components help you to achieve considerable cost savings. The valve concepts with a variable structure and the efficient control technology provide both low purchase costs and low energy consumption.

The design of the valves and individual components without dead space satisfies the most exacting hygienic requirements and prevents unnecessary product losses. Thanks to the metallic stops, the seals used are characterized by a very long service life. This significantly cuts operating costs.

The GEA Tuchenhausen design concept reduces consumption of valuable energy and helps you to cut your water consumption, as well as the use of chemicals.

The ingenious maintenance concept additionally ensures that the personnel and time required for necessary maintenance work can be reduced to a minimum.

Thus, your investment in innovative process technology from GEA Tuchenhausen will quickly repay itself.

Economical

Higher product quality

Reduced consumption of energy, water and cleaning media

Reduced time and personnel costs for maintenance and cleaning

You score points with environmental protection

Lower consumption of energy, water and chemicals means less pollution for the environment. GEA Tuchenhausen meets these requirements by complying with binding international standards.

As a user of GEA Tuchenhausen products, you benefit from proven environmentally-friendly production processes, as well as the high standards for hygienic processing and care of your products. This makes a significant contribution to protecting the global environment and climate.

With our products, you show how important sustainable operating methods are to you and that you take responsibility for future generations!

Our support is your gain

In addition to our product range, you can also make use of the individualized engineering support from GEA Tuchenhausen. Even before you have started using our products, this support provides you with extensive digital tools – from technical drawings to 3-D models.

The individualized service concepts from GEA Tuchenhausen ensure that maintenance work is conducted with the lowest amount of production downtime possible.

We look forward to creating and customizing a maintenance plan for you.

Sustainable
Lower climate and environmental impact
Sustainable, environmentally friendly production processes
High standards for hygienic processing and care of products

Service-oriented
Individual engineering support
Shortest possible interruptions of production
Individual service concept

Hygienic valves and components

Hygienic valves and components are suitable for CIP/SIP, easy to maintain, offer reliable function and represent a significant factor in consistent product quality. Low costs with operation, maintenance and service ensure economical system productivity.

The highly flexible VARIVENT® modular system is the basis for the hygienic valves and components of GEA Tuchenhausen. The result is economic efficiency for the system operator, optimized stock keeping and low-cost spare parts production due to the reduced diversity of parts.

Modular system
Greater flexibility because of the ability to adapt rapidly to process changes
High economic efficiency
Low spare part stocks

Hygienic design
Lower risk of contaminating the end product
Maximum efficiency in cleaning
Lower CIP costs

Sealing according to the VARIVENT® principle

The hygienic valves and components offered by GEA Tuchenhausen are characterized by special seal technology. A metallic stop results in defined seal deformation, ensuring long seal life. This allows for more time to pass between required maintenance services, thereby allowing for continuous production and shorter downtimes. The special grooved shape in the valve disc ensures the seal has a secure hold at all times up to a pressure differential of 10 bar during switching. The seal geometry was optimized by using FEM calculations.

Hygienic valves and components

VARINLINE® instrumentation free of dead pockets

The trademark VARINLINE® includes control and measuring instruments that meet the requirement of being CIP/SIP-able, thus enabling cleaning and sterilization without the need for dismantling. The instruments can be cleaned and sterilized without any residue in automatic cleaning and sterilizing process cycles. The core piece of the in-line control and measurement technology is the process connection fitting, the VARINLINE® housing. It is mainly an in-line housing with double vertical ports with two process connections.

The process connections in the VARINLINE® housing allow up to two control / measuring instruments, e.g. a sight glass with opposite illumination unit or different measuring mountings. They are available for all pipe sizes, with the VARIVENT® process connection designed for the nominal width of the respective components to be installed. VARINLINE® housings are self draining – also in the vertical installation orientation – and thus permit instrumentation free of dead zones. VARINLINE® housings are 3A approved, according to the DGRL and are EHEDG-certified.

VARICOMP® expansion compensator

VARICOMP® expansion compensators compensate for expansions and tensions in pipeline systems that result from temperature differences. Due to the dead-zone free design, they are able to be used in hygienic and aseptic processes.

VARIVENT® valves with special function

The high flexibility in the VARIVENT® system offers many advantages. With the ability to combine all basic elements with one another, the system offers a broad range of possible applications. Existing valve systems in process installations can be modified or enhanced without changing the current system concept.

Housings and other components from the VARIVENT® modular kit are used e.g. in control valves, overflow valves and vacuum valves.

VARITOP® tank safety systems

The VARITOP® tank safety system consists of a modular system and thereby forms a functional unit designed individually according to the customer's requests.

The diverse applications of the VARITOP® system range from tank cleaning to protecting tanks against high and low pressures to gassing and degassing of tanks.

VARICOVER® product recovery systems

VARICOVER® product recovery systems are designed for use in fully automatic operations with maximum cleaning demands. They are used to recover valuable products from pipelines – an important consideration to optimize the economic efficiency of a process system. Pigging pushes the product from the pipes and returns it to the production cycle.

A VARICOVER® product recovery system usually comprises of a pig cleaning station, a pig catching station with propellant medium valves and a pig.

Pipe classes

Standard VARIVENT® valve housings and VARINLINE® housings are supplied with welding ends, although the components can be delivered with various connection fittings as an option (see section 7).

The dimensions of the welding ends comply with the following standards:

Metric		Inch			ISO	
DN	Outside diameter according to DIN 11866, series A	OD IPS	Outside diameter based on ASME-BPE-a-2004, DIN 11866, series C	Outside diameter according to IPS schedule 5	ISO	Outside diameter according to DIN 11866, series B
10	13.0 × 1.50				13.5	13.5 × 1.6
15	19.0 × 1.50				17.2	17.2 × 1.6
25	29.0 × 1.50	1"	25.4 × 1.65		21.3	21.3 × 1.6
40	41.0 × 1.50	1 ½"	38.1 × 1.65		33.7	33.7 × 2.0
50	53.0 × 1.50	2"	50.8 × 1.65	60.3 × 2.00	42.4	42.4 × 2.0
65	70.0 × 2.00	2 ½"	63.5 × 1.65		48.3	48.3 × 2.0
80	85.0 × 2.00	3"	76.2 × 1.65	88.9 × 2.30	60.3	60.3 × 2.0
100	104.0 × 2.00	4"	101.6 × 2.11	114.3 × 2.30	76.1	76.1 × 2.0
125	129.0 × 2.00				88.9	88.9 × 2.3
150	154.0 × 2.00	6"	152.4 × 2.77	168.2 × 2.77	114.3	114.3 × 2.3

Surfaces

The standard for surfaces in contact with the product depends on the particular nominal width standard:

- **Metric, inch OD, ISO:** $R_a \leq 0.8 \mu\text{m}$
- **Inch IPS:** $R_a \leq 1.2 \mu\text{m}$

Higher-quality surfaces are an available option (see section 7).

Surfaces not in contact with the product (housing) are matte blasted or metal ground as standard. Detailed information on surface designs can be taken from the respective sections.

Materials

Components in contact with the product are produced from 1.4404 (AISI 316L), while those not in contact with the product use 1.4301 (AISI 304). Other materials, e.g. for use when handling aggressive fluids, are available on request.

For detailed information about the properties of the materials, refer to the **material properties** table.

Test report and inspection certificate

Optionally, the valve housings and product wetted parts can be supplied with a test report 2.2 or an inspection certificate 3.1 according to EN 10204.

If 3.1 inspection certificates are required, please notify us of this when you place the order.

Seal materials

Seals in contact with the product are EPDM (standard), HNBR, FKM and FFKM (on request; not available for all components). NBR material is used for seals not in contact with the product.

The mixing constituents of our seal materials conform to the USP class VI and are contained in the FDA White List. In this the sealings fulfill FOOD and DRUG (FDA) guidelines 21 CFR Part 177.2600 or 21 CFR 177.1550: "Rubber articles intended for repeated use".

The resistance of the seal material depends on the type and temperature of the product being transported. The contact time with certain products can negatively affect the service life of seals. The seal material PTFE is available for individual valve types and components as well.

For detailed information about the seal material properties, refer to the **seal material properties** table.

Housing connections

For valves with the option of combining housings, such as overflow and control valves, the clamped housing connection forms a flexible selection of the port orientation.

Clamped housing connection:
Seat ring clamped by clamping connection

Ambient conditions

Ambient temperatures	
Hygienic valves and components (with connection 0)	0 °C to 45 °C
	32 °F to 113 °F
Proximity switches	-20 °C to 80 °C
	-4 °F to 176 °F

The valves can also be used outdoors. However, in these application areas they must be protected against icing, or else de-iced before switching or lifting. In addition, the particular requirements on the control and feedback system must be taken into account in this case.

The product or operating temperature depends on the seal material and can be seen in the **seal material properties** table.

Installation

Hygienic valves and components must be installed without stresses. Lateral forces such as expansion of the pipelines due to heat cannot be compensated in the valve, as a result valve damages are possible. In such cases, we recommend taking measures to compensate for the expansion, such as by using the VARICOMP® expansion compensator.

The required clearance for installing and removing a component is specified in the particular technical data and dimensional sheet.

Air supply

The valve actuators are configured for operation with min. 4 bar and max. 8 bar air pressure. The standard actuator sizes are configured for an air supply pressure of min. 6 bar (with a product pressure of 5 bar). The quality of the air supply must meet the requirements of ISO 8573-1:2010.

ISO 8573-1:2010	
Solid content	Quality class 6
	Particle size max. 5 µm
	Particle density max. 5 mg/m³
Water content	Quality class 4
	Max. dew point 3 °C
	A correspondingly different dew point is required for applications at high altitude or with low ambient temperatures.
Oil content	Quality class 3
	Max. 1 mg oil per 1 m³ air, preferably oil-free

Feedback

In the control top

See section 9: Control and feedback systems

In the lantern (LAT)

Proximity switches of size M12×1 can indicate the positions “open” and/or “closed”. In double-seat valves with lifting actuator, it is also possible to detect the upper valve disc stroke in the lantern by means of a proximity switch (see section 9: Control and feedback systems).

For detecting the end positions by proximity switches in these valves, it is recommended to use the proximity switch holder (INA) on the actuator (see section 9: Control and feedback systems).

Recommended flow direction

If possible, the valves should close against the flow direction so to avoid water hammer. Exception: Constant pressure valve type DHV, sampling valve type I and vacuum valve type V.

The certificates in this list are valid for the corresponding hygienic valves and components in the GEA portfolio. Valves that meet the requirements of the European Hygienic Engineering and Design Group (EHEDG) as well as those of 3-A Sanitary Standards, Inc. (3-A SSI) are available for many

fields of application. Additionally, numerous valves have been demonstrated to offer trouble-free and efficient cleaning ability in independent, standardized cleaning tests – for optimum safety and high savings potentials.

VARINLINE® instrumentation free of dead pockets

The matrix piping found in process technology makes it difficult for the operator to directly view his product. The installation of VARINLINE® housings into the pipeline system permits integration of measurement and control instruments in the process system and thus, structuring the production process transparently.

Cleaning and sterilization capacities in the CIP/SIP procedures have the highest priority, as well as to ensure hygienic production in the brewery and beverage industries, dairy processing operations and the chemical, pharmaceuticals and cosmetic industries.

General benefits
No domes, no sumps
Gap-free sealing according to the VARIVENT® principle
Rapid, accurate instrument installation with clamp connection
Connections for instrumentation independent of nominal widths and process variables
Detection of the respective measuring values directly in the product flow
Perfect flow properties and cleaning ability

Function of the VARINLINE® components

The adaptation of the meters in the VARINLINE® housings takes place via VARINLINE® process connections. Many manufacturers have assumed this established process connection type and offer meters for installation in VARINLINE® fittings as standard. This ensures hygienic and quick integration of different devices into the process system.

The process connections offer the option of holding up to two VARINLINE® components in one housing

Application examples

The VARINLINE® concept has proven its worth in hygienic processes. VARINLINE® housings permit installation of transmitters free of dead zones and thus, permit use of sensors in systems with high hygienic requirements.

The VARINLINE® system comprises of components for process monitoring, such as pressure, temperature and flow measurement.

Optimized process circuits reduce product loss, e.g. by measurement of the color, clouding or conductivity of the product to divert the ejections.

The GEA Tuchenhausen level probe is used as media recognition to protect the pumps or control filling of tanks.

Special features

Four different process connection sizes

Combination options of up to two devices in one VARINLINE® housing

Different adaptation options in tanks

VARINLINE® housing according to four different pipe standards

EHDG certification of the housing

The GEA Breconcherry In-Line Sprayer type IS 25 can also be utilized in the respective process fittings for container and pipe cleaning.

For adapting measurement and control instruments in tanks, VARINLINE® housing connections and tank connection flanges for welding into wall, cone or dished bottoms are available.

Formation of a dome by conventional adaptation at the T-piece

Holder in the VARINLINE® housing free of dead zones

VARINLINE® housings

The VARINLINE® housing is the process connection that is the core element to the control and measurement technology. It is free of dead zones in pipeline systems.

Depending on the housing rated width and the installation depth of the instrumentation, up to two control or measuring instruments can be adapted into the double vertical port in-line housing. Only the nominal widths DN 10 and 15 as well as ISO 13.5 to 21.3 are an exception with only one process connection.

To meet the nominal width of the pipeline, housings with four different process connection sizes are available.

The pipe inside diameter corresponds to the inner height of the housing.

VARINLINE® housing connection flange type T and T-S

The housing connection flanges type T and T-S serve to adapt measurement and control instruments free of dead zones, e.g. for installation of VARINLINE® pressure gauges and sight glasses. This connection flange may be welded into the tank or vessel wall flush from the inside, in the cone or dished bottom.

The housing connection flange type T is designed for installation into vessels of a wall thickness up to 8 mm.

Due to its cylindrical shape, the housing connection flange of type T-S allows adjustment to the inclination or curve of the vessel bottom or vessel wall and is thus suitable for installation in tanks with smaller diameters (≤ 1.6 m).

For stress-free installation, a welding device is available (available for rent as well), which facilitates the reliable and simple installation. When welding in, the regulations of the weld must be complied with.

The conical inner contour permits a flat installation orientation

Cylindrical shape for adaptability to eccentric positions

Process connection sizes

The process connections are available in four sizes.

*** See catalog aseptic valve technology

VARINLINE® housing connection flanges type U and U-S

The housing connection flange type U is used to adapt a measurement and control instrument free of dead zones, e.g. a VARINLINE® thermometer or a level probe. The flange may be welded into the tank or vessel wall front-flush, in the cone or dished bottom. The housing connection flanges type U and U-S are particularly suitable for installation of measuring technology at jacketed tanks due to their cylindrical form.

The housing connection flange type U-S is used for vertical holding of a measurement and control instrument free of dead zones. Its cylindrical shape allows the adjustment to the inclination of the cone or dished bottom and therefore allows for vertical installation of sight glasses and measuring instruments outside the vessel bottom.

For stress-free installation, the housing connections should be welded in with an inserted plug. Apart from this, the regulations of the weld must be complied with.

Conical inner contour permits flat installation orientations

Cylindrical shape permits adjustment to the inner tank contours

VARINLINE® tank connection flange type P

The tank connection flange type P is used for front-flush installation with no dead zones of a measurement and control instrument. This flange type is suitable for installation into vessels of a wall thickness up to 20 mm.

The flange is equipped with pressure relief half-rings and a pressure relief bore for controlled discharge of the inner tank pressure for maintenance work.

For stress-free installation, a welding device is available (available for rent as well) which facilitates the reliable and simple installation. When welding in, the regulations of the weld must be complied with.

Possibility of pressure relief in the tank

Sealing according to the VARIVENT® principle

A defined seal deformation allows for more time to pass between required maintenance services, thereby allowing for continuous production and shorter downtimes.

The seal geometry was optimized by using FEM calculations.

Representation of the stress load on the housing O-ring

Seals	
Long operating time	
Vacuum-proof	
Selection of FDA-compliant seal materials	
• EPDM	
• FKM	
• HNBR	
• FFKM	
• PTFE	

VARINLINE® pressure gauge

The Bourdon tube pressure gauge is equipped with a sealing diaphragm. A diaphragm provides separation from the measuring material and transmits the process pressure to the meter via a transmission medium. If pressure is applied from the measuring medium now, it is transmitted via the elastic diaphragm to the liquid and thus, to the meter.

The specifically constructed setup of this pressure gauge achieves a low temperature influence and permits use of the device for over- or under-pressure measurements.

According to the requirements of the FDA, the indicator is filled with certified glycerin (or insulation oil at equip with proximity switches) to permit dampening of the indicator under strong vibrations and to avoid formation of precipitation if the temperatures fluctuate strongly.

Thus, the pressure gauge is outstanding for use in the food industry. It is available for process connection sizes B, F and N. Depending on the installation position of the pressure gauge, different orientations are available for best reading of the display.

Pressure gauge with process connection B

Pressure gauge for vertical installation

VARINLINE® sight glass

The VARINLINE® sight glass can be inserted into the VARINLINE® housing or the housing connection flanges and serves visual product inspection. The glass closure of borosilicate glass can be used, depending on nominal width, for a pressure range of -1 bar to 25 bar: however, the pressure level of the installed fittings must be considered as well.

For good visual inspection even in cloudy media, an additional illumination is recommended. The durable LED illumination with 20 LED's and a 3-pole M8 connector optional disposes of a three-core connection cable with a length of 2 or 25 m. The 2W illumination can either be operated manually via an integrated tactile switch or automatically via the SPS. An ATEX lighting without a tactile switch can be delivered for use in potentially explosive atmospheres.

VARINLINE® sight glass
without illumination

VARINLINE® sight glass with
illumination

VARINLINE® sight glass with
ATEX illumination

VARINLINE® thermometer

The precision gas system thermometer has a sturdy design and is characterized by its optimal and completely welded installation into the VARINLINE® process connection. It ideally meets the high requirements to hygienic process technology.

According to the requirements of the FDA, the indicator is filled with certified glycerin (or insulation oil at equip with proximity switches) to permit dampening of the indicator under strong vibrations and to avoid formation of precipitation if the temperatures fluctuate strongly.

The VARINLINE® thermometer is ideal for use in the food industry. It is available for process connection sizes F and N. Depending on the installation position of the thermometer, different orientations are available for best reading of the display.

Thermometer with connection down

Thermometer with connection up

Pipe classes

Standard VARINLINE® housings are supplied with welding ends, although the housings can be delivered with various connection fittings as an option.

The dimensions of the welding ends comply with the following standards:

- **Metric:** Outside diameter according to DIN 11866, series A
- **Inch OD:** Outside diameter based on ASME-BPE-a-2004, DIN 11866, series C
- **Inch IPS:** Outside diameter according to IPS sched. 5
- **ISO:** Outside diameter according to DIN 11866, series B

Surfaces

The standard for surfaces in contact with the product depends on the particular nominal width standard:

- **Metric, inch OD, ISO:** $R_a \leq 0.8 \mu\text{m}$
- **Inch IPS:** $R_a \leq 1.2 \mu\text{m}$

Higher-quality surfaces are an available option.

Surfaces not in contact with the product (housing) are matte blasted as standard. Alternatively, a ground outer surface is available.

Materials

Components in contact with the product are produced from 1.4404 (AISI 316 L), while those not in contact with the product use 1.4301 (AISI 304). Alternatively (standard for nominal width standard ISO and DN 10/15), VARINLINE® housings and housing connection flanges are also available in 1.4435 (AISI 316L). Other materials, e.g. for use when handling corrosive fluids, are available on request.

For detailed information about the properties of the materials, refer to the **material properties** table.

Test report and inspection certificate

Optionally, the valve housings and product wetted parts can be supplied with a test report 2.2 or an inspection certificate 3.1 according to EN 10204.

If 3.1 inspection certificates are required, please notify us of this when you place the order.

Seal materials

Seals in contact with the product are made of EPDM (standard), HNBR, FKM, FFKM and PTFE. EPDM will be supplied if no seal material is specified in the orders.

The mixing constituents of our seal materials conform to the USP class VI and are contained in the FDA White List. In this the sealings fulfill FOOD and DRUG (FDA) guidelines 21 CFR Part 177.2600 or 21 CFR 177.1550: "Rubber articles intended for repeated use".

The resistance of the seal material depends on the type and temperature of the product being transported. The contact time with certain products can negatively affect the service life of seals.

For detailed information about the seal material properties, refer to the seal material properties table.

The tank connection flange is welded into vessels with a wall thickness up to 20 mm and takes a measurement or control instrument free of dead zones. Pressure relief half-rings can be used for controlled relief of the inner tank pressure.

The VARINLINE® housing connection flanges and VARINLINE® tank connection flanges are welded into the vessel wall or the vessel bottom with a welding jig to protect against distortion. Since the different heat introduction when welding may cause deformation of the flanges and thereby leaks, the flange with the installed welding jig must be allowed to cool off to 30 °C. All conditions required for welding (such as insert gas, cooling, welding additive) can be taken from the respective welding instructions.

VARINLINE® housing connection U and U-S

Process connection	Lock (welding device)
F	221-144.01
N	221-144.02
N for type U-S	221-144.02
G	221-144.04
Required welding instructions 221RLI002534EN	

The required welding jig corresponds to a plug with half-ring connections.

Code	TTIA		-								

For order codes differing from the standard version, please refer to section 7 (options).

The level probe works conductively in connection with conventional evaluation electronics. The electrodes are mainly used in tanks for level control during vessel filling or emptying. The coated electrode rod (Ø 10 mm) can be shortened as required and also serves to collect media in pipelines, e.g. as pump protection.

Technical data	
Material in contact with the product	1.4404, PEEK

Jacketed VARINLINE® housings

For keeping chocolate or margarine fluid or for cooling ice cream, jacketed VARINLINE® housings are available. For heating or cooling products, a hot or cooling medium is passed through the housing jacket in the opposite flow direction.

VARINLINE® pressure relief half rings

The VARINLINE® pressure relief half-rings are used for controlled channeling of the inner pipe pressure at maintenance or mounting work. The respective VARINLINE® process connection can also be used for taking up a measuring or control instrument*.

* Not suitable for installation of a VARINLINE® sampling valve type TSVN or TSVU.

VARINLINE® adapters

The flexibility in the VARIVENT® system offers many advantages. Often, adjustments or modifications are required in existing valve systems of a process system. Use of a VARINLINE® adapter permits inserting a VARINLINE® process connection into a VARIVENT® housing, thereby integrating in-line control and measurement* free of dead zones in a valve housing.

Use and function

An O-ring is used for sealing the VARIVENT® flange connection, and is given a defined range of compression by a metal stop. The O-ring is also protected by the special geometry of the recess from being pulled out at high flow rates.

The VARIVENT® flange connection is available as a complete connection including O-rings, screws and nuts, as well as in components (grooved and plain flanges).

The range also contains VARIVENT® blind flanges that are also available as grooved and plain flanges. They are used for shutting off pipelines, e.g. when expansion of the system is only planned for a later time.

Complete connection including bolts and nuts

Grooved flange including connecting elements and O-ring

Plain Flange

Function method of the expansion compensator

The innovative VARICOMP® expansion compensator compensates for expansions and tensions that result from temperature differences in the pipeline system. Its special design principles allow for use in aseptic processes as well.

A decisive benefit of the VARICOMP® expansion compensator is its dead-zone free design with drain characteristics. This design meets the prerequisites for best cleaning in CIP/SIP-processes.

Special features

Suitable for hygienic and aseptic applications

EHEDG-certified

Design with no dead zones

CIP/SIP-able

Short, compact design

Compensation element available in EPDM and FKM

Compensation distances (tension/compression) limited by metallic stop

Maximum compensation distance 8 mm

Compensation element with integral vulcanized support rings for high pressure loads

1 VARIVENT® flange

2 O-Ring

3 Internal flange

4 Snap ring

5 Compensation element

6 Half ring

7 Leakage display

Technical features	
1	Gap-free sealing
2	Pipe-flush, even passage
3	Flange used to fix the compensation element
4	Snap ring for the transmission of force (sealing)
5	Metallic stop (defined sealing pressure, no excessive strain on the compensation element)
6	Fixing of the compensation element at the external ring
7	Defined compensation distance due to metallic stop (tensile/compressive stress) at the external ring, no excessive strain on the compensation element
8	Additional sealing to the outside provided by O-rings

Application ranges

VARICOMP® expansion compensators are used especially in valve blocks and matrix piped systems to compensate for thermal stress in pipeline systems resulting from thermal expansion. They are designed for hygienic and aseptic applications in the dairy, beverage and food industries, as well as in the pharmaceutical, fine chemical, biotechnological and cosmetic industries. The expansion compensators can be used as an alternative for Ω -bends.

Valve block with VARICOMP® compensators

The compensation element

The elastomer compensation element takes up tensions as the core piece of the compensator and compensates for them.

Technical features	
1	Sprayed compensation element of elastomer (EPDM and FKM available)
2	Vulcanized-in support rings of stainless steel for support at pressure load (excess pressure and negative pressure)
3	Vulcanized-in carrying rings for fastening the compensation element
4	Smooth inner faces

VARIVENT® control valves

VARIVENT® control valves are used for control of applications where constant parameters are required. With gases, vapors or liquids, the valve series is characterized by reliable control of the process.

With many configuration options available, these control valves offer the best economical solutions for individual process requirements. Based on the proven VARIVENT® sealing and housing technology, maximum hygiene is ensured.

VARIVENT® sampling valves

VARIVENT® sampling valves are designed for many different tasks. Both manual sampling of very small amounts and the incorporation into fully automatic, mix-proof sampling and dosage systems are possible. Thanks to the VARIVENT® modular principle, the sampling valves can be easily integrated into process lines and vessels, while fully complying with hygiene requirements.

VARIVENT® overflow valves

Critical pressures in pipeline system can be secured cost-effectively by overflow valves. They are mostly applied in combination with displacement pumps.

VARIVENT® constant pressure valves

A compact design and high function characterize the VARIVENT® constant pressure valve. It is designed for compensating for process-related pressure fluctuations and to keep production-relevant pressures at a constant level at all times.

VARIVENT® vacuum valves

VARIVENT® vacuum valves offer reliable protection from negative pressures. Small differential pressures and a fail-safe construction mark this valve series. The upside down design of the valve disc prevents sucking in of dirt particles into the vessel and thus into the product.

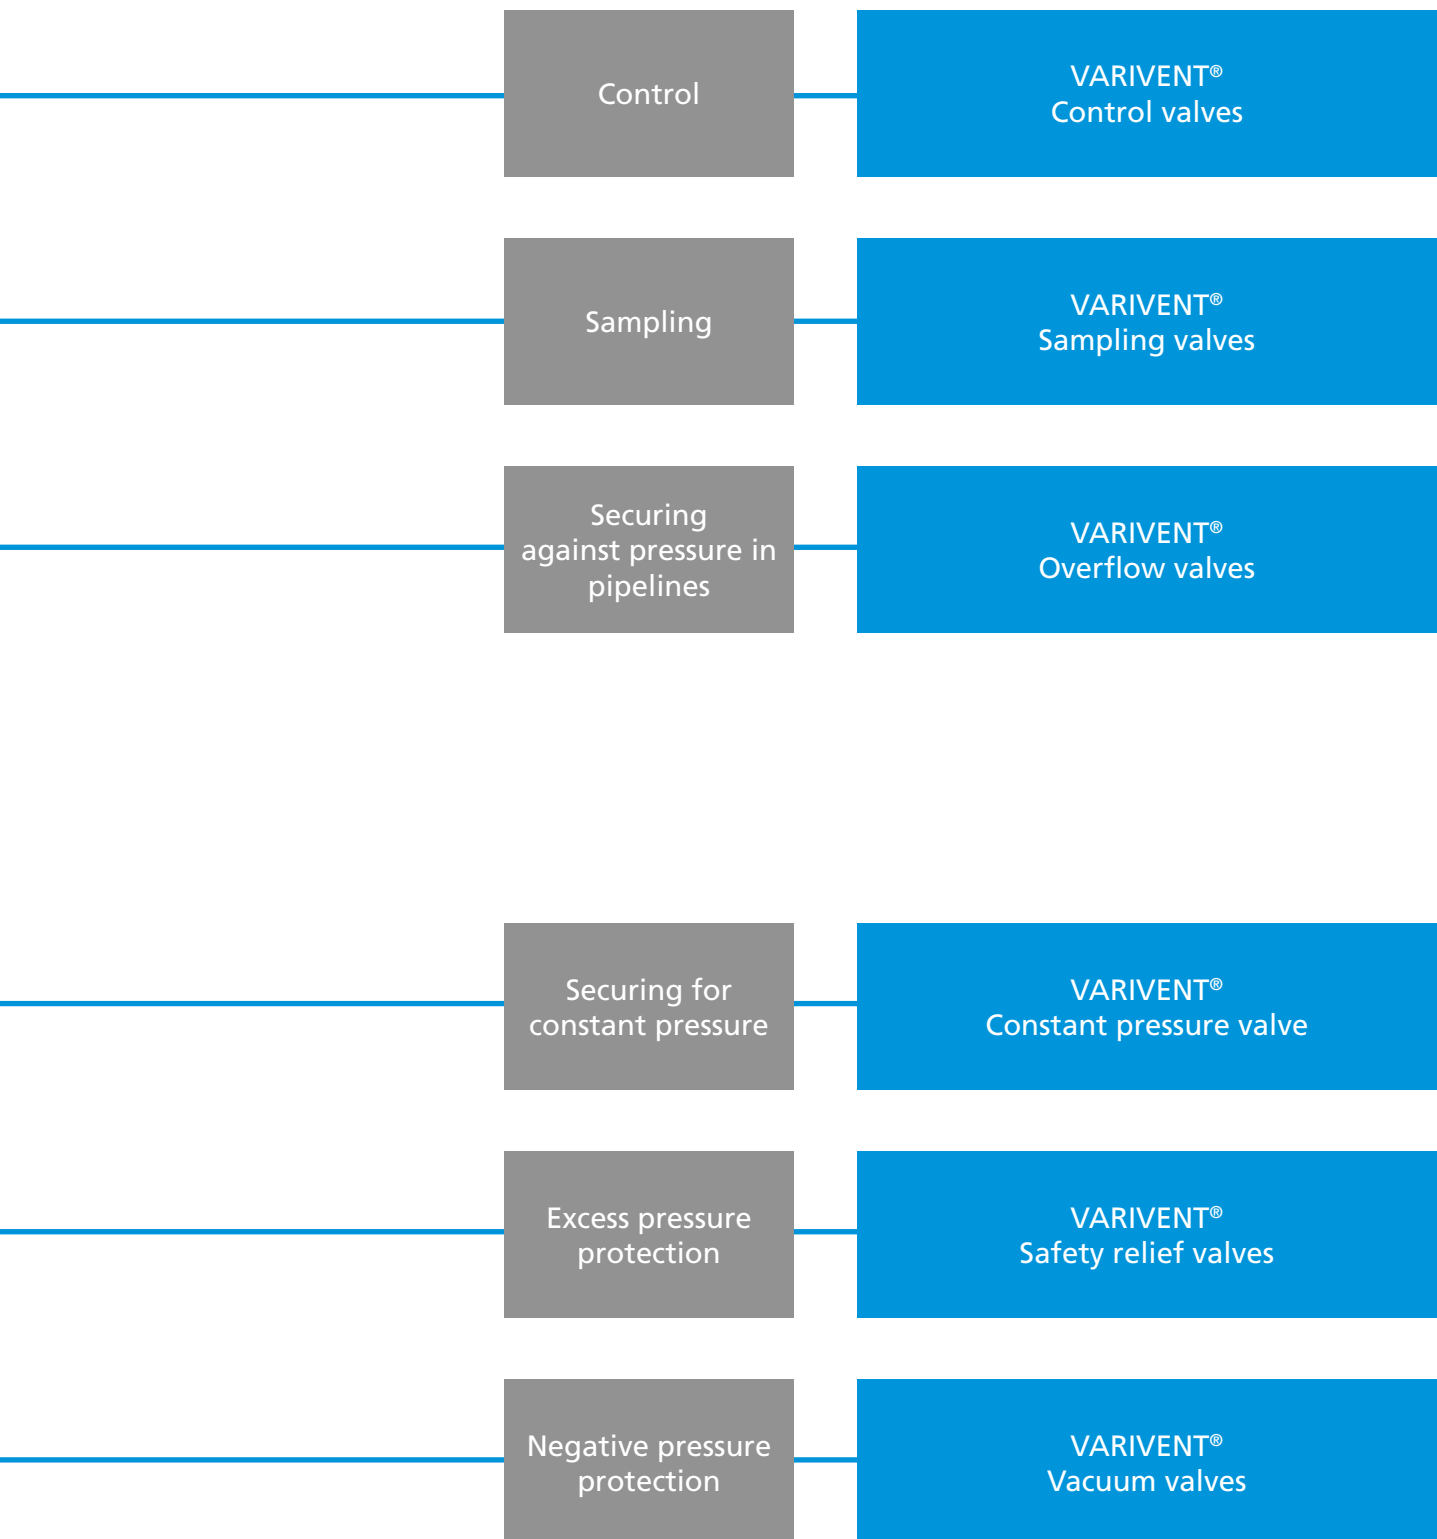

VARIVENT® safety relief valves

VARIVENT® safety relief valves work purely mechanically and offer reliable protection against critical process pressures. The often proven valve contributes to protection from pressure-bearing vessels in various applications. The hygienic design ensures full cleaning capability.

**VARIVENT® valves
with special function**

VARIVENT® control valves

To ensure an economical system productivity, it is necessary to keep the operation, maintenance and servicing costs at a minimum. At the same time, increasing cost pressure leads to higher expectations toward technology, quality and service and more comprehensive and stringent statutory provisions.

The VARIVENT® system's modular design makes it possible to individually adjust control valves to specific process requirements. This results in economic efficiency for the system operator, optimized stock keeping, and cost-effective spare parts production due to the low diversity of parts.

The integration of the control valves into the process control technology has a decisive impact on the quality of the control and the product. Preventive maintenance of the control valves ensures the system's high availability.

General benefits
Proven sealing geometry
Dead zone-free VARIVENT® housing
Maximum cleaning efficiency
Low spare part stocks
Positioner for a large variety of requirements

Valve function

Control valves serve as actuators in control loops. In this process, the particular control valve works as a throttle device that sets the desired flow rate by changing the pressure loss in a pipeline.

Technical design

The linear or equal percentage control cone and the corresponding valve seat are located in the completely cleanable, dead zone-free VARIVENT® housing. The exchangeable seat ring with an associated control cone allows the selection of several Kvs values per nominal width; subsequent adjustments to changes in the operating conditions are possible at any time. All control cones are available in either a soft- or a metallic-sealing version.

The open lantern allows easy detection of potential leakages due to a defective stem seal.

Detachable clamp connections between the individual modules enable the control valve's quick assembly and maintenance. The valves are available in both effective directions, spring-to-close (NC) and spring-to-open (NO).

Positioners determine the valve's stroke with a high level of accuracy; a variety of designs allows for ideal integration into the process control.

Application examples

The need for strict adherence to standards in food production requires that control valves be designed to comply with the food and beverage industry’s maximum hygiene demands.

In the manufacture of drugs by the pharmaceutical industry and in chemical process systems or in the technical use of enzymes, cells and microorganisms, any contamination would endanger the process results as well. Therefore, the application of dead zone-free control valves is required, which can be cleaned efficiently and without leaving residue.

VARIVENT® valves enable germ-free processes. The control valves meet high hygiene requirements and allow the cleaning of pipes according to the efficient CIP or SIP procedure.

Control valves are used for pressure regulation, flow control, or for the mixing of liquids. Typical applications include: Temperature control in heat exchangers, tank pressure control, wort aeration, or the dosing of a variety of different media. A number of different control valves is available that are adjusted to various control tasks.

Special features
Modular design for flexible adaptation to application conditions
Linear and equal percentage control cones
Soft- or metallic-sealing valve discs
Low maintenance and assembly due to detachable clamp connections
Positioner for a large variety of requirements

4.1

Control valve with a soft-sealing valve disc

VARIVENT® control valves

The VARIVENT® system's modular design offers numerous optional implementations for the valve's optimal adaptation to the process. The portfolio comprises two different valve types. Type S has a diaphragm actuator and a positioner, whereas the type P control valve is equipped with a VARIVENT® air/spring actuator and a T.VIS® P-15 positioner.

VARIVENT® control valve type S

VARIVENT® control valve type P

Housing combinations

VARIVENT® control valves are available with different housing combinations.

Valve seat version

The use of clamped housing connections during the valve's installation achieves a high degree of flexibility. The valve seat is installed between the housings by means of a clamp connection. This makes it possible to adjust the valve's port orientation to the particular orientation of the pipeline system.

Housing combination with two housings

Housing combination with one housing and housing connection

The interchangeability of the seat ring and the associated valve disc enables the subsequent adjustment of the required Kvs value.

The following table shows an overview of all available Kvs values per nominal width:

* For gas applications

Control characteristic

The characteristic of a control valve denotes the Kv value's dependence on the stroke, as specified by the control cone's shape. Here, linear or equal percentage control cones are available.

In a valve with a linear characteristic, the Kv value changes in a linear fashion in relation to the stroke, while the equal percentage characteristic leads to a percentage change of the free flow area identical to the change in stroke.

A control valve with a linear characteristic is used for controls in which the valve causes more than 30 % of the overall pressure loss in the line system, e.g., in a level control. For all other applications the use of an equal percentage control cone is recommended. This is the case for approx. 90 % of all applications.

A Kvs value is the flow in m³/h of water at a temperature of 5–30°C that flows through the fully opened valve at a pressure loss of 1 bar.

It is customary to select a Kvs value for the valve that is approx. 30 % higher than the maximum Kv value calculated for the particular operating conditions. Thus, a reserve is generated that offsets fluctuations or changes of the design data to a certain extent.

The control valves with a 3-stage seat have a linear control characteristic. The metallic-sealing valves are used to control large pressure differentials in order to counter-act cavitation.

The three-way control valves can be provided as flow mixers or flow dividers. They are only available with linear control cones in the metallic-sealing design.

Control valve with linear control cone

Control valve with equal-percentage control cone

Recommended flow direction

In order to fulfill a reliable modulating function, and to prevent water hammers when closing the valve during the product flow, it is recommended to direct the flow through VARIVENT® control valves counter to the control cone's fail-safe position.

Sealing acc. to the VARIVENT® principle

The hygienic control valves are characterized by a special seal technology. A metallic stop causes a defined seal deformation. This achieves a longer service life in the process system - which means shorter downtimes and a continuous production.

The special groove form in the valve disc ensures a secure hold of the seal at all times up to a pressure differential of 10 bar during the switching. In order to minimize the danger of cavitation, the pressure loss between the upper and the lower housing should be kept as low as possible. The sealing geometry was optimized by means of FEM calculations.

Representation of the stress load of the housing O-ring and the V-ring

Seals
High operating time
Vacuum-proof
Selection of FDA-compliant sealing materials
<ul style="list-style-type: none"> • EPDM • FKM • HNBR • FFKM

If the applied control valves do not need to assume an additional shut-off function, or if a higher leakage rate of the seat seal is tolerable, it is also possible to use control valves with a metallic seat design. These valves offer the advantage of even lower maintenance requirements.

Metal seat design

Distinguishing features of VARIVENT® control valves

VARIVENT® control valves are available in two designs. While type S uses a diaphragm actuator in combination with a positioner, type P is equipped with a VARIVENT® air/spring actuator and the TVIS® P-15 positioner. Both variants differ exclusively in the actuator's design.

All components are based on the VARIVENT® modular system principle. This provides the option to convert either the type S or the type P control valve to the particular other valve type at a later time.

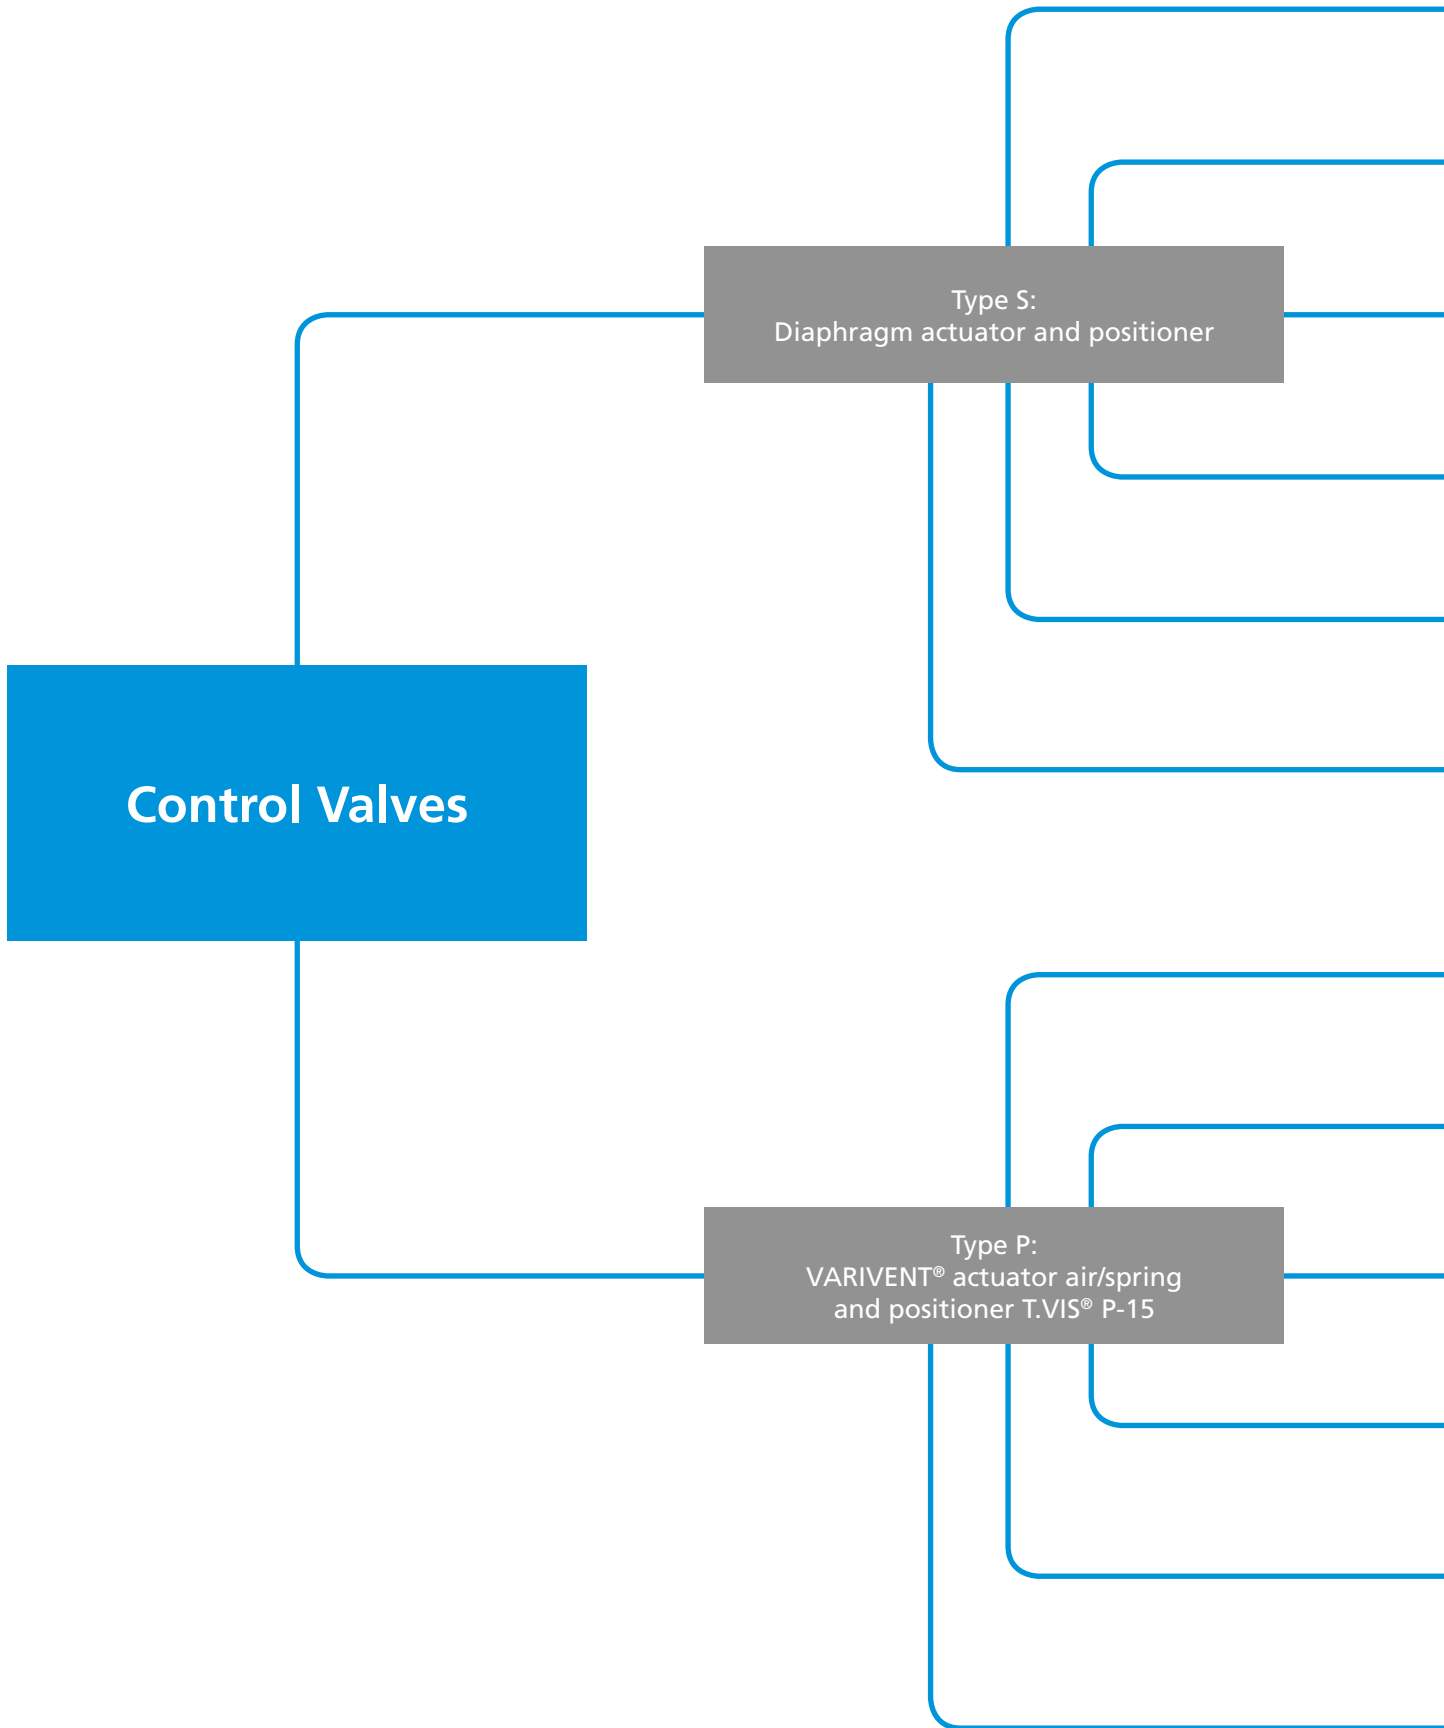

Both the components in contact with the product as well as the strokes are identical in type S and type P control valves

The type S control valve was designed for fast, high-precision process controls. Due to a different operating principle, the type P control valve works at a slightly slower speed. It is not possible to offer a delimitation according to simple or difficult control tasks or applications, since the control quality must always be considered individually in connection with the superordinate process control.

However, both series can be differentiated based on their options. Process-related requirements toward the valve can have a decisive effect on the selection.

	0----- Order code for positioners, see at the end of the Section Control Valves index					

* Maximum product pressure is 7.5 bar.

The code is composed as follows, depending on the chosen configuration:

Position	1	2	3	4/5	6	7	8	9	10	11	12	13	14	15	16
Code	S		F	/									N		0-----

For order codes differing from the standard version, please refer to section 7 (options).

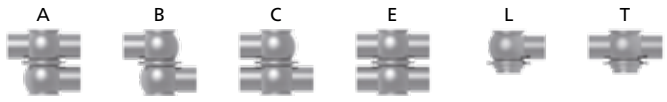

Technical data of the standard version	
Control characteristics	Linear
Recommended flow direction	Against closing direction
Material in contact with the product	1.4404 (AISI 316L)
Material not in contact with the product	1.4301 (AISI 304)
Seal material in contact with the product	EPDM, FKM, HNBR
Ambient temperature	0 to 45 °C
Air supply pressure	4–7 bar (58–101.5 PSI)
Product pressure	DN 25–65, OD 1"–2 ½", IPS 2" 0–16 bar* (0–232 psi)
	DN 80–150, OD 3"–6", IPS 3"–6" 0–10 bar (0–145 psi)
Surface in contact with the product	DN, OD $R_a \leq 0.8 \mu\text{m}$ IPS $R_a \leq 1.2 \mu\text{m}$
External housing surface	Matte blasted
Positioner	I/P positioner; type 3725
Actuator type	Diaphragm actuator air/spring
Connection fittings	Welding end
Identification	Adhesive ID tag
Valve seat version	Clamped seat ring
Certificates	  

* We recommend the metallic seat design at a differential pressure of more than 10 bar.

Position	1	2	3	4/5	6	7	8	9	10	11	12	13	14	15	16
Code	S		X	/		M						2	N	/2F	+ 0-----

For order codes differing from the standard version, please refer to section 7 (options).

Description

Positioners compare the set value from a superordinate controller (PLC) to the stroke of the control valve and convert it into a pneumatic actuator pressure that is sent to the diaphragm actuator. A mechanical return of the current position of the actuator stroke can balance out changes regarding operating pressure and actuation energy automatically. This improves the accuracy and reduces the actuation time. Interferences such as friction or flow influences are balanced out by the positioner itself. The positioners can be used in the normal and split range operation.

The positioners are directly assembled to the diaphragm actuator of the control valve, which means the pneumatic connections are realized without additional tubes or hoses.

Function of the positioner

Positioners convert an electrical or pneumatic input signal into a corresponding output signal (set position).

Differentiation acc. to type of signal

Pneumatic/electro-pneumatic positioner

A difference is made acc. to the input signal between pneumatic (p/p) and electro-pneumatic (i/p) positioners.

Pneumatic (p/p) positioners

For pneumatic devices, the input value is a mechanical signal with a pressure of 0.2 to 1 bar (3 to 15 psi) and the output value is an actuator pressure up to 6 bar (90 psi) at most.

Type 3766

Electro-pneumatic (i/p) positioners

For the electro-pneumatic positioners, the input is an analog direct current signal of 4 to 20 mA or a digital signal (PROFIBUS®, FOUNDATION™ Fieldbus). The input signal is converted into the corresponding required pressure with an integrated circuit. The output signal is an actuation pressure with up to 6 bar (90 psi).

Type 3725

Type 3730

Type 3767

Special features of digital positioners

Simple operation
Display with switchable reading direction
Automatic setup of the neutral point and the range during the initialization process (except type 3730-0)
Independent recognition of errors in the actuator
Movement direction independent of the installation orientation
Continuous monitoring of the zero point
Minimized air consumption
Fail-safe storage of all parameters

The respective positioners can be equipped with further accessories. The positioners of type 3730-3 additionally permit HART®-communication between field and process

control level. The positioners type 3730-4 and type 3730-5 integrate control valves into fieldbus systems via PROFIBUS® PA or FOUNDATION™ fieldbus.

16–21	Control and feedback system TP15XXX Order code for positioner T.VIS® P-15 see register 9																																																																																																																																																																																																																																																																																																																																																																					

The code is composed as follows, depending on the chosen configuration:

Position	1	2	3	4/5	6	7	8	9	10	11	12	13	14	15	16 to 21					
Code	P		F	/	S					L0			N	/52	+	TP15	I		P	A

Technical data of the standard version	
Recommended flow direction	Against closing direction
Material in contact with the product	1.4404 (AISI 316L)
Material not in contact with the product	1.4301 (AISI 304)
Seal material in contact with the product	EPDM, FKM, HNBR
Ambient temperature	0 to 45 °C
Air supply pressure	5–8 bar (73–116 psi)
Product pressure	DN 25–65, OD 1"–2 ½", IPS 2" 0–16 bar* (0–232 psi)
	DN 80–150, OD 3"–6", IPS 3"–6" 0–10 bar (0–145 psi)
Surface in contact with the product	DN, OD $R_a \leq 0.8 \mu\text{m}$
	IPS $R_a \leq 1.2 \mu\text{m}$
External housing surface	Matte blasted
Control and feedback system	Positioner T.VIS® P-15
Actuator type	Air/spring
Connection fittings	Welding end
Identification	Adhesive ID tag
Valve seat version	Clamped seat ring
Certificates	

* We recommend the metallic seat design at a differential pressure of more than 10 bar.

16–21	Control and feedback system TP15XXX Order code for positioner T.VIS® P-15 see register 9																																																														

The code is composed as follows, depending on the chosen configuration:

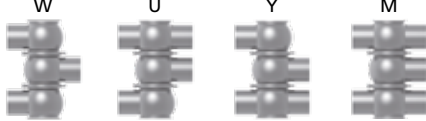

Position	1	2	3	4/5	6	7	8	9	10	11	12	13	14	15	16 to 21					
Code	P		X	/	S		M		L0			2	N	/52	+	TP15	I		P	A

Concept

The positioner T.VIS® P-15 represents a low-cost alternative to proven positioners. The controller is equipped with a highly precise path measuring system and can move to any valve position between the taught open/close positions in combination with an air-spring actuator.

The T.VIS® P-15 is characterized not only by its performance but also by its ease of operation and outstanding price/performance ratio.

Standard variant

- 1 Pneumatic block
- 2 Control unit
- 3 Path measuring system
- 4 Solenoid valves
- 5 LED lighting
- 6 2 push buttons
- 7 Exchangeable filter
- 8 M12 plug connection
- 9 Supply air throttle
- 10 Exhaust air throttle

Features

Automatic initialization
Simple and safe operation
Manual operation of the process valve
Valve status display by LED
Open/close position feedback (optional)
Selectable dead band (control hysteresis)
High-quality pneumatic fittings
High potential for cost reduction
Standard protection class IP66

Structure

The T.VIS® P-15 is equipped with a precise path measuring system for detecting its position.

The necessary wiring for control and feedback is configured using M12 plug connections that can be accessed externally.

The control top can be opened for this.

Operation and configuration of the T.VIS® P-15 takes place either by the two push buttons mounted on the cap or, with the cap removed, via the buttons below. The push buttons are secured electronically against inadvertent or incorrect operation, while in operating mode.

The T.VIS® P-15 is equipped with adjustable supply and exhaust air throttles as standard, through which the control quality can be adjusted individually.

Position control

The T.VIS® P-15 position controller works with an integrated microprocessor which contains the software for operation, visualization as well as intelligent position detection and evaluation. When a nominal value is specified (4–20 mA), e.g. by the PLC, the process valve can be set to any required position. The push buttons on the cap also make it possible to specify a nominal value manually, in order to set the process valve to the required position. The position is detected using a position transducer and is automatically controlled using two integrated solenoid valves. The position of the cone can also be permanently evaluated using the analog actual value output, as well as, three binary outputs in the PLC.

Setting

Automatic – following unlocking, simply pressing the two buttons on the cap of the T.VIS® P-15 starts the initialization process which runs fully automatically. There is no need to open the position controller for this purpose, resulting in particularly quick, easy and safe commissioning of the position controller (on average < 1 minute).

Immediately after the setup, end position tolerances, control hysteresis and control settings can be set.

Visualization

LED display:

- Green
- Yellow
- Red
- Blue
- Blue flashing

Feedback

- Standard: valve position 0–100 %, opening amount (4–20 mA)
- Option: additionally 24 V DC feedback signals for open/close position and error output

Service mode

Activation of the main stroke, which may be required in VARIVENT® Control Valves Type P with closed (non-actuated) position for valve maintenance, is performed using the service mode that can be activated by the buttons. At the same time, all feedbacks are stopped (warning to the system control). Furthermore, input signals from the control room are not implemented by the T.VIS®, in order to protect the employee.

Field of application

In addition to use on VARIVENT® control valves of type P, the T.VIS® P-15 can also be used on VARIVENT® and ECOVENT® seat valves and T-smart disc valves to control the valve disc position. Opening the valves to specific intermediate positions makes it possible to influence the hydraulic characteristics of the system.

The code is composed as following, depending on the chosen configuration:

Position	14	15	16	17	18	19	Options						
Code	TP15	I		P	A								

Typical application and description

Horizontal tank valves or horizontally installed valves are configured so the connection piping can be completely drained.

Tangential valve housings are provided with eccentrically welded-on vertical ports, as a result, no fluid remains in the housing sphere of the horizontal installation.

Various nominal widths are available. If required, please contact GEA Tuchenhausen to ask about the dimensions and feasibility.

Available nominal widths

Typical application and description

As one of the basic elements of the VARIVENT® modular system, the actuator air/spring is used for performing the valve movement in all VARIVENT® valves.

The air supply is connected to the particular control and feedback system and led via the internal air channel under the piston surface of the actuator. Simply by reversing the actuator, it is possible to convert the fail-safe position of the valve (in single-seat valves) from spring-to-close (NC) to spring-to-open (NO). In these cases, or if the product or air supply pressure differs from the standard, check the definition of the actuator size based on the selection sheets from page 178 onwards.

Typical application and description

For manual operation of VARIVENT® valves.

The manual actuator is designed as a handwheel up to the nominal width DN 100 or 4". With larger nominal widths, the manual actuator is designed as a crank. The manual actuator can be locked in any position using a lock nut.

One full turn of the manual actuator results in a valve stroke of 11 mm, irrespective of the nominal width.

Code	S	B	F	- DN80/DN80 -	Z	M	80	-	350	8	-	S	-	1	2	N	/5	+	0-----

Typical application and description

Mechanically adjustable limit on the stroke.

The maximum stroke can be reduced by using a mechanically adjustable limit stop. The limit stop limits either the opening or the closing stroke of the valve. The minimum stroke is 5 mm.

It is not possible to install a proximity switch as a feedback function in the lantern!

NOTE: The limit stop can not be used simultaneously with a sterile lock.

Typical application and description

The sterile lock is used for reliable separation between the surface of the valve disc in contact with the product and the atmosphere.

Applying sterilizing media to the sterile lock prevents contamination of the product from atmosphere due to the switching movement of the valve stem ("elevator effect").

If the media has a tendency towards crystallization, this effect can be avoided by pressurizing the sterile lock with a liquid and securing the shaft seal against damage.

If this option is selected with valves with double stem guide, both the upper and the lower stem feedthrough will be equipped with a sterile lock.

Available nominal widths

Code	S	B	F	- DN80/DN80 -	Z	M	80	-	350	8	-	S	-	1	2	N	/24	+	0-----

Typical application and description

The double guidance of the valve stem is recommended to avoid vibrations that may result from the flow dynamics within the valve body. The additional bearing of the stem in the lower housing is available from a nominal width of DN 80, OD 3", IPS 3" onwards. Modulating control valves with 3-stage seat* and divert valves* are equipped as standard with double stem guide.

Code	S	B	F	- DN80/DN80 -	Z	M	80	-	350	8	-	S	-	1	2	N	/2F	+	0-----

Typical application and description

For transporting VARIVENT® and ECOVENT® valves with pneumatic actuator for assembly and maintenance purposes.

The transport device is screwed into the piston stem of the actuator after removal of the control and feedback system and thus permits secure transport with available lifting equipment. The transport device must be removed before commissioning.

Available nominal widths

Inch OD	OD	1" – 6"
Inch IPS	IPS	2" – 6"

Available valve types	
VARIVENT® control valve	P

Technical data	
Material	1.4301
Connection size	M14
Article number	221-104.98

Typical application and description

For manual actuation of pneumatic VARIVENT® valves if there is a power failure as well as for actuation during maintenance and assembly work.

The emergency manual actuator attachment NOH is used for manual activation of all pneumatically operated VARIVENT® valves as well as for maintenance and assembly work on all valve types. Radial sealing valves with lifting actuator represent an exception to this. The manual emergency actuator cannot be used in these valves.

Control Valve Design

Formula symbols used:

Q	= Flow rate (liquid)	[m ³ /h]
Q _N	= Flow rate (gas) at the standard condition	[m ³ /h]
p ₁	= Pressure upstream of the valve	[bar abs.]
p ₂	= Pressure downstream of the valve	[bar abs.]
Δp	= Differential pressure	[bar]
ρ	= Density (liquid)	[kg/m ³]
ρ _N	= Density (gas) at the standard condition	[kg/m ³]
η	= Dynamic viscosity	[mPas]
T ₁	= 273+t ₁ = Operating temperature	[Kelvin]
	= Operating temperature	[°C]

1. Kv value calculation:

Kv-value = Valve-stroke-dependent flow volume Q in m³/h referring to water at t = 5 to 30 at a differential pressure of Δp = p₁ - p₂ = 1 bar in the control valve.

For low-viscous liquids:

$$Kv = \frac{Q}{31.6} \sqrt{\frac{\rho}{\Delta p}} \left[\frac{m^3}{h} \right]$$

For gases:

- Subcritical pressure reduction at Δp < 0.5 p₁ or p₂ > 0.5 p₁

$$Kv = \frac{Q_N}{514} \sqrt{\frac{\rho_N \times T_1}{\Delta p \times p_2}} \left[\frac{m^3}{h} \right]$$

- Over-critical pressure reduction at Δp < 0.5 p₁ or p₂ < 0.5 p₁

$$Kv = \frac{Q_N}{257 \times p_1} \sqrt{\rho_N \times T_1} \left[\frac{m^3}{h} \right]$$

Over-critical pressure reduction = strong noise development

Example 1: low-viscous liquid

Q = 30 m³/h, ρ = 1000 kg/m³, Δp = 0.5 bar, p₁ = 7 bar

$$Kv = \frac{30}{31.6} \sqrt{\frac{1000}{0.5}} \approx 42.46 \left[\frac{m^3}{h} \right]$$

At different operating conditions:
Highest throughput and lowest differential pressure.

For high-viscous liquids:

$$Kv_T = \frac{Q}{31.6} \sqrt{\frac{\rho}{\Delta p}} \left[\frac{m^3}{h} \right]$$

$$Kv_L = \frac{1}{1.05} \left(\frac{Q \times \eta}{216 \times \Delta p} \right)^{\frac{2}{3}} \left[\frac{m^3}{h} \right]$$

$$\frac{Kv_T}{Kv_L} < 0.46 \Rightarrow Kv_L = Kv \quad \frac{Kv_T}{Kv_L} > 20 \Rightarrow Kv_T = Kv$$

$$0.46 < \frac{Kv_T}{Kv_L} < 20 \Rightarrow \text{Calculation as below}$$

$\frac{Kv_T}{Kv_L}$	0.46	0.52	0.59	0.68	0.8	1.00	1.35	1.9	3.0	4.9	9.5	20
F _R	0.46	0.50	0.54	0.58	0.62	0.68	0.74	0.80	0.86	0.90	0.94	0.98

$$Kv = \frac{Q}{F_R \times 31.6} \sqrt{\frac{\rho}{\Delta p}}$$

2. Determination of the Kvs value and the valve size

The chosen Kvs value must be above the calculated Kv value. This ensures that the control valve works even at deviating operating data (Reserve).

There are two cases for this:

Linear control cone

$$Kv_{req.} = \frac{Kv \text{ value calculated}}{\approx 0.7}$$

Equal-percentage control cones

$$Kv_{req.} = \frac{Kv \text{ value calculated}}{\approx 0.6}$$

3. Determination of the control cone

The characteristic curve of the control valve is defined as the dependence of the Kv value from the stroke. Control valves are performed either with an equal-percentage or a linear characteristic curve. The equal-percentage characteristic curve is characterized by stroke changes leading to same percentage changes of the particular Kv value. For a linear characteristic curve, same stroke changes cause changes to the Kv value.

The selection of the control cone depends on the ratio of the pressure reduction $\Delta p = p_1 - p_2$ in the control valve at maximum flow to the pressure reduction Δp_{ges} in the entire system.

- Linear control cones are used if more than 30% of the total pressure drop is caused in the line system of the control valve. Level control is a typical example for this.
- Equal-percentage control cones are used if less than 30% of the total pressure drop is caused in the line system of the control valve; these are approx. 90 % of the applications of the control valves.

Example:

$Kv = 42.5 \text{ m}^3/\text{h}$, equal-percentage control characteristics

$$Kv_{req.} = \frac{42.5}{0.6} = 70.8$$

According to the data sheet, a Kvs value of $80 \text{ m}^3/\text{h}$ must be chosen, i.e. management of the control task set requires a valve of DN 80.

4. Determination of the nominal width and actuator size of the valve

Calculation of the actuator forces is the basis for the actuator selection scheme. The diaphragm actuator to be chosen acc. to the required closing force is determined depending on the selected Kvs value of the valve and the maximum product pressure. This information must be specified in the order.

Example:

Chosen Kvs = 80, $p_1 = 7 \text{ bar}$, ($Q = 30 \text{ m}^3/\text{h}$)

A valve nominal width of DN 80 is chosen from the data sheet. An actuator of size 350 results. Based on the flow volume, a flow speed of 1.6 m/s through the valve results.

VARIVENT®/VARINLINE®

VARIVENT®/VARINLINE® valves are characterized by their ease of operation and flexibility. The modular design of the VARIVENT® modular system offers the user a wide range of options. The variable system of VARIVENT®/VARINLINE® products permits adjustable use of the valves.

Function of the valve

The sampling valves can be installed either by the process connection options of the VARINLINE® housing or through direct connection in the process. The valve is manually or pneumatically opened for sampling. The valve position can be reported to the PLC via proximity switches. An integrated metallic stop in the actuator prevents excess pressure on the seals.

Application examples

Sampling valves can be employed in a variety of situations. In practice, these valves are often integrated into the processes of the dairy, brewing or beverage industries. An example of a typical application is in the fermentation tanks of breweries.

Special features

- | |
|--|
| Certified hygienic design |
| Flexibility because of the modular principle |
| Simple connection options |

Sampling valve VARIVENT® type I

The sampling valve VARIVENT® type I is installed into the process system upright. The actuator is dually configured so that the valve can be actuated pneumatically or manually. Due to the conical contour of the valve disc, smaller sample volumes can be tapped as well. The VARIVENT® type I valve can be expanded with various individual components. Using up to two proximity switches permits detection of the closed and/or open valve positions.

Sampling valve VARINLINE® type TSVN and TSVU

The sampling valve VARINLINE® type TSV in the versions N and U can be installed into the process system vertically or horizontally. The VARIVENT® modular system makes the valve compatible with the VARINLINE® product family. The connection sockets of the sampling housing permit integration of the valve into a sampling system or alternatively connecting the second port to the CIP supply. The illustrated model shows version N. In version U, the valve disc closes for the product side and therefore additionally protects against product loss in water hammers. The valve type TSV is also available as an aseptic sampling valve with stainless steel bellows.

Sampling valve VARIVENT® type T/09

The mixproof sampling valve type T/09 of series VARIVENT® is used as a fully automatic sampling and dosing valve. The sampling line can be cleaned or sterilized immediately after sampling via connected CIP-/SIP-loop. The design as a mixproof double-seat valve ensures that the process can be executed safely in the connected tank during cleaning or sterilization.

Fully automated sampling

The double-seat valve can be fitted on the tank simply with the connection through a tank flange. The VARIVENT® interface permits installation of all common TVIS® control tops so that the valve can be used for fully automated sampling. The mixproof design as double-seat valve offers the option of cleaning and sterilizing the sampling line independently of the tank.

Simple dosage

The compact double-seat valve is very suitable for the dosage of smaller liquid volumes into larger process lines. The inline connection provided as standard permits easy insertion of the valve into the common VARINLINE® housings (process connection N) and seals flush with the pipe – free of dead zones.

Sampling

The sampling valve is available with single or double horizontal ports in the sampling line. The sampling line is always size DN 15. The process connection N as standard connects the valve directly to the tank via tank flanges.

For tank or pipe cleaning, the valve disc is lifted and the cleaning media flow into the leakage chamber. This cleans the seal of the valve disc and discharges the cleaning media through the periphery. The V-ring of the double disc seals off the cleaning medium against percolation into the sampling chamber.

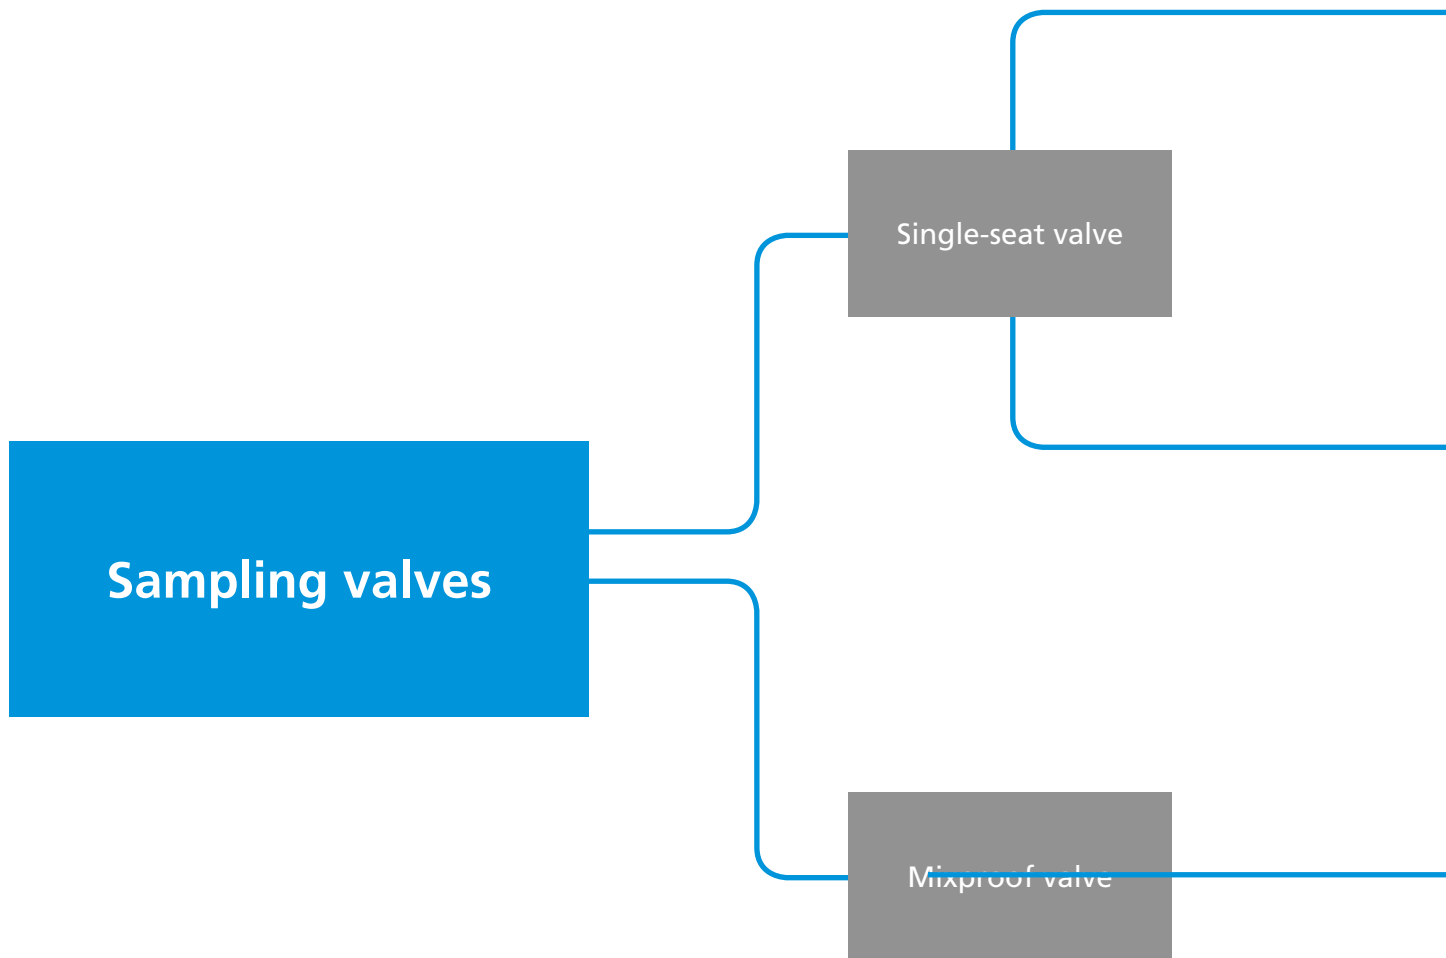

Cleaning the leakage chamber

Cleaning the leakage chamber takes place via the lift functions of the two valve discs during the pipeline or tank cleaning phases. This function ensures an individual lifting of the individual valve discs independently of each other.

The advantages
Permits fully automated sampling
Completely drainable even in the horizontal installation
Small, compact and light-weight
Level shut-off free of dead zones

Special features
Mixproof
VARIVENT® sealing principle
Both valve discs can be cleaned via lifting function
VARINLINE® connection flange
Equipment with common feedback systems possible

4.2

The code is composed as follows, depending on the chosen configuration:

Position	1	2	3	4	5	6	7	8	9 to 14
Code	I		-			N		/52	+

For order codes differing from the standard version, please refer to section 7 (options).

Typical application and description

Various types of connection flanges are available for a reliable and no-loss discharge of the sample volume. The threaded connection as a basis permits easy installation of the connection sleeves. The following sleeves are present for the sampling valve type I.

Hose nozzle

The connection type “Hose sleeve” offers the option of targeted discharge of the sample through a hose.

Flammable nozzle straight

The connection type “Flammable nozzle straight” has been constructed for the vertical installation orientation. The burner can be used to sterilize the flammable nozzle.

Flammable nozzles 90°

The connection type “Flammable nozzle 90°” has been constructed for horizontal sampling or installation orientation. A burner is recommended to sterilize the nozzle.

Spiral-type flammable nozzle

The connection type “Spiral-type flammable nozzle” is used in CO₂-containing and foaming liquids. The flammable nozzle can be sterilized with a burner.

Outlets deviating from the standard

The threaded connection in G3/8" presents the standard connection of the outlets. Deviating from the standard connection, alternative outlets are available for the flammable nozzle.

Outlet KEOFITT

The outlet KEOFITT is used for aseptic sampling systems with quick couplings.

Outlet SCHÜTT

The outlet SCHÜTT can be connected with a clamping connection to a sampling vessel.

Outlet AL clip-on

This outlet is connected to a corresponding sampling valve. It additionally can be used to connect pipes or a sealing cap.

Outlet LUER

The LUER outlet connection is designed for cannulas or hoses with an inner diameter of 4 mm. It is sealed via the conical design of the outlet, the LUER cone.

Outlet LUER 90°

In the LUER 90° connection, the sampling process takes place in accordance with the outlet type of LUER. The outlet LUER 90° is used for vertical pipeline routing. The sampling valve is installed horizontally.

VARIVENT® overflow valves

VARIVENT® overflow valves are used to reduce excess pressure or pressure spikes and are used to protect the pipeline system and the components installed in it.

Application examples

VARIVENT® overflow valves are mainly used for overpressure protection downstream of displacement pumps. The valves are installed so that the respective pump will convey the medium in a circle and the pressure cannot increase further.

Sizes		
Type F	Type M	Type F-CJ
Opening pressure adjustable via a spring	Opening pressure adjustable via a spring and with pneumatic lifting	Opening pressure adjustable via a spring with pneumatic actuator (D-Force)
DN 25 – DN 100		
OD 1" – OD 4"		
IPS 2" – IPS 4"		

Representation of the stress load of the housing O-ring and the V-ring

Function of the valve

The VARIVENT® overflow valve regulates the respective opening pressure of the valve with a manually adjustable actuator. When the set pressure is exceeded, the valve will open. The special contour of the valve disc and the seat ring effect a controlled diversion of the product flow so that the valve continues to remain open in spite of the pressure relief starting. This way, flutter of the valve is avoided.

The overflow valves can be equipped additionally with up to two proximity switches in the lantern. This permits feedback of the valve disc position.

Special features

- Hygienic design
- Metallic stop
- Flexibility because of the VARIVENT® modular principle
- Proven VARIVENT® seal geometry
- Availability of the three different actuator types
- Low investment and maintenance costs
- Mismatched housing combinations available

Sealing according to the VARIVENT® principle

The VARIVENT® overflow valves are characterized by special seal technology. A metallic stop results in defined seal deformation, ensuring long seal life. This allows for more time to pass between required maintenance services, thereby allowing for continuous production and shorter downtimes.

The special, grooved shape in the valve disc ensures the seal has a secure hold at all times, up to a pressure differential of 10 bar during switching. The seal geometry has been optimized by using FEM calculations.

Overflow valves with metallic seat design can be used to secure a pressure difference above 10 bar. When selecting the valve, the permitted maximum pressures of the housings and the possible setting pressures of the actuators must be considered. These valves offer the benefit of lower maintenance requirements.

Metal seat design

Recommended flow direction

In order to ensure the desired safety function of the valve during product flow, the VARIVENT® overflow valves must have a flow contrary to the fail-safe position of the valve disc. An upright installation orientation of the valve is recommended.

Actuator types of the overflow valves

The spring-to-close actuators available for the overflow valve (F) are to be set to the desired set pressure with a setting screw. Different spring packages are available to permit different pressure ranges. Take them from the table **Adjustable set pressures**.

The overflow valves are optionally available with an additionally integrated pneumatic actuator (M). This permits individual lifting of the valve disc during pipe cleaning.

The cleaning media flows past the seal of the lifted valve disc, cleans the seal surfaces and the seat area and then drains through the upper housing. This ensures hygienic cleaning of all areas in contact with the product.

The D-Force actuator permits holding shut of the valve against a higher pressure during specific production steps. This is a combination of two actuators: the overflow valve actuator with set screw (F) and an air/air actuator (CJ).

The D-Force actuator combination by air pressure allows deliberate keeping shut of the valve against higher pressures than the mechanically set pressure. This properly is required specifically for the production of carbonated beverages, since a pressure increase may result in nearly any process step here. There will be gasification of the product and foam formation in the pipeline. This actuator also permits lifting of the valve disc during cleaning.

VARIVENT® constant pressure valve

The VARIVENT® constant pressure valve is used to set a constant pressure at the input side of the valve. When process-related pressure fluctuations occur, the piston will open or close automatically so to compensate for them. The product pressure to be maintained in the housing is set by the air supply pressure in the actuator. Due to this, a constant air supply pressure is required.

Special features

Mechanically limited open/close position of the valve disc
PTFE-valve disc with low friction
Simple maintenance, only two seals
Good control properties
Kvs values depending on requested flow
Hygienic design
Approval according to 3-A

Function of the valve

In the VARIVENT® constant pressure valve, the exit opening opens when the pressure acting on the ring face of the valve disc is larger than the holding force of the piston set via the air pressure. If the product pressure drops, the valve will close automatically in order to maintain a constant pressure in the inlet socket.

Additionally, the lower part of the valve disc is equipped with a control cone to optimize the function method of the valve.

The valve disc of the constant pressure valve is made of PTFE with very good resilience against corrosive fluids and only low friction during the lifting movement.

The PTFE valve disc is lifted by the product flow

Recommended flow direction

In order to ensure the desired safety function of the valve during product flow, the flow needs to be directed laterally against the valve disc of the VARIVENT® constant pressure valve. An upright installation orientation of the valve is recommended.

Application examples

VARIVENT® constant pressure valves are used to keep the pressure constant at the output of a separator. The self-adjusting VARIVENT® constant pressure valve offers a cost-efficient alternative to a control valve. No additional pressure transmitter is required since the valve will work independently after setting the product pressure.

Furthermore, the VARIVENT® constant pressure valve is used to maintain the required pressure at heat exchangers.

Nominal width			Kvs
DN 40/25	OD 1½"/1"		4
DN 40/40	OD 1½"/1½"		4
DN 40/40	OD 1½"/1½"		10
DN 65/50	OD 2½"/2"		16
DN 65/65	OD 2½"/2½"		25
DN 65/65	OD 2½"/2½"		35
DN 65/65	OD 2½"/2½"		60

Additional equipment

Optionally, the valve can be equipped with a quick vent or a fine pressure controller. The supply and exhaust quantity permits precise setting of the air supply pressure above the piston surface so that the desired content product pressure can be regulated on the input side of the valve.

Quick venting valve with muffler

Safety relief valves

VARIVENT® safety relief valves have been specifically developed for the requirements of the food, beverage and pharmaceuticals industries and meet the requirements of the relevant rules, such as DIN 11866 or ASME BPE. Due to the inlet area free from dead zones, the unique elastomer bellows and the optional pneumatic lifting, the valves are characterized by very good cleaning ability (CIP/SIP). Many connections permit best adjustment of the valves to different tasks.

Function of the valve

Full stroke safety relief valves are used in areas where surge flows or very fast pressure increases occur, due to their quick opening response. The main application is in pressure relief of steams and gases. Since the full stroke safety relief valve performs a full stroke after opening – no matter the pending flow rate – the full flow rate can be discharged even at a slight pressure increase.

Normal safety relief valves are ideal pressure relief valves. Their large proportional range leads to a continuous operating method and relief of pressure spikes specifically in liquids. The valves have a full stroke charge after an expanded proportional phase and thus reach a higher flow rate. They are also used as overflow valves and are used when the smallest design of the full stroke safety relief valve is too large already.

To ensure hygienic cleaning (CIP) or sterilization (SIP) of all surfaces in the system, the safety relief valves are available with a pneumatic lifting mechanism.

Special features

High-quality materials and surface finish
Manual or pneumatic lifting
Insensitive to temperature
Welded housing in CIP-able design
Self-draining housing shape free of dead zones ensures free drain

Application examples

Safety relief valves protect from excess pressure, e.g. for vessels within a sterilization process or during filling. They secure fermentation tanks in case of unexpected faults.

Safety relief valves are also used for inner pressure relief of vessels and other process equipment for curing media such as chocolate.

HyTight Assembly

Ease of cleaning – this is a requirement for the design of the VARIVENT® safety relief valves type 488. They are equipped with HyTight Assembly and therefore offer the best cleaning opportunities.

HyTight means Hygienic and Tight.

Advantages of the elastomer bellows
Increased tightness by O-ring seal
Elastomer bellows to protect difficult-to-clean components in the guide and spring cap
Fixing elements are placed within the bellows
Gap-free installation parts, exposed, flooded O-rings

Difficult-to-clean components are protected from contact with the product by use of an elastomer bellows. Please observe that an elastomer bellows is not counterpressure-compensating like a stainless steel bellows.

Recommended flow direction

In order to ensure the desired safety function of the valve during product flow, the VARIVENT® safety relief valves must have a flow contrary to the fail-safe position of the valve disc. The installation orientation of the valve, upright or horizontal, is essential for the operating pressure.

Full stroke safety relief valve type 488

The safety relief valves in the series 488 has been developed in close cooperation with system operators and manufacturers. They reliably protect process systems from excess pressure without putting hygienic requirements at risk. The whole series has been configured and officially approved according to international standards (DGR 97/23/CG, ASME, GOST et al.). A version for steam, gases and liquids of each valve has been type-tested by TÜV in accordance with German regulations. They comply with the EU directive for pressure equipment and bear the CE symbol.

The VARIVENT® safety relief valve type 488 more than meets the special hygienic and performance requirements of the food, brewery and beverage industries. The valves have been developed for a great performance range and are mostly used in large plants, breweries and the beverage industry.

Safety relief valve type 488

Special features
Low contamination by bacteria and other contaminations
Minimized dead space in the inlet and flush installation possibility
Gap-free design of the internal assembly
Medium-contacting surface requirements according to DIN 11866 and ASME BPE
Use of FDA compliant elastomers
One-part spindle for higher setting accuracy and less friction
Valve stem and guide protected by EPDM bellows
Approvals worldwide

Normal safety relief valve type 483

The safety relief valves of series 483 have been developed for small to medium outputs. This type meets the properties of VARIVENT® safety relief valves type 488 and can be used in all areas of the food and beverage industries. The valves are used in applications such as bottling systems.

Normal safety relief valve type HyCom

HyCom normal safety relief valves have proven to be a cost-effective option for the VARIVENT® safety relief valves series 488. The HyCom series meets the requirements according to European PED 97/23/EC and AD2000 regulations. The valves are type-test approved by TÜV for non-toxic gases, steams and non-sticky liquids (fluid group 2). The HyCom safety relief valve is available with nominal widths DN 25 to DN 80.

Special features

Standardized design

Manual and pneumatic lifting actuators available

CIP/SIP-able

Design with no dead zones

Seat heating (option)

Set pressure 0.5 to 10 bar

Liftings

The safety relief valves of the series VARIVENT® are equipped with a gas-tight lifting of the valve disc. This design characteristic permits cleaning media (steam or cleaning liquid) to flow through the valve during the cleaning process.

Manual lifting H4

The manual lifting H4 is a unique construction that clearly differs from the conventional lifting. The valves of nominal width DN 25 are equipped with a rotating lifting mechanism in which the safety relief valve opens when the cap turns. The valve remains opened until it is closed again by another turn of the cap. In larger valves, the valve disc can be lifted with a lever lift.

Turning lifting

Lever lifting

Pneumatic lifting H8

The pneumatic lifting H8 permits cleaning (CIP) or sterilizing (SIP) in the system. By pressurization of the lifting with air, the valve disc in the spindle is lifted from its seat and the flushing medium (steam or cleaning media) flows through the safety relief valve.

Depending on the setting and lifting pressure (compressed air supply), a double piston version (in exceptions also a triple piston lifting mechanism) can be required instead of the single piston design.

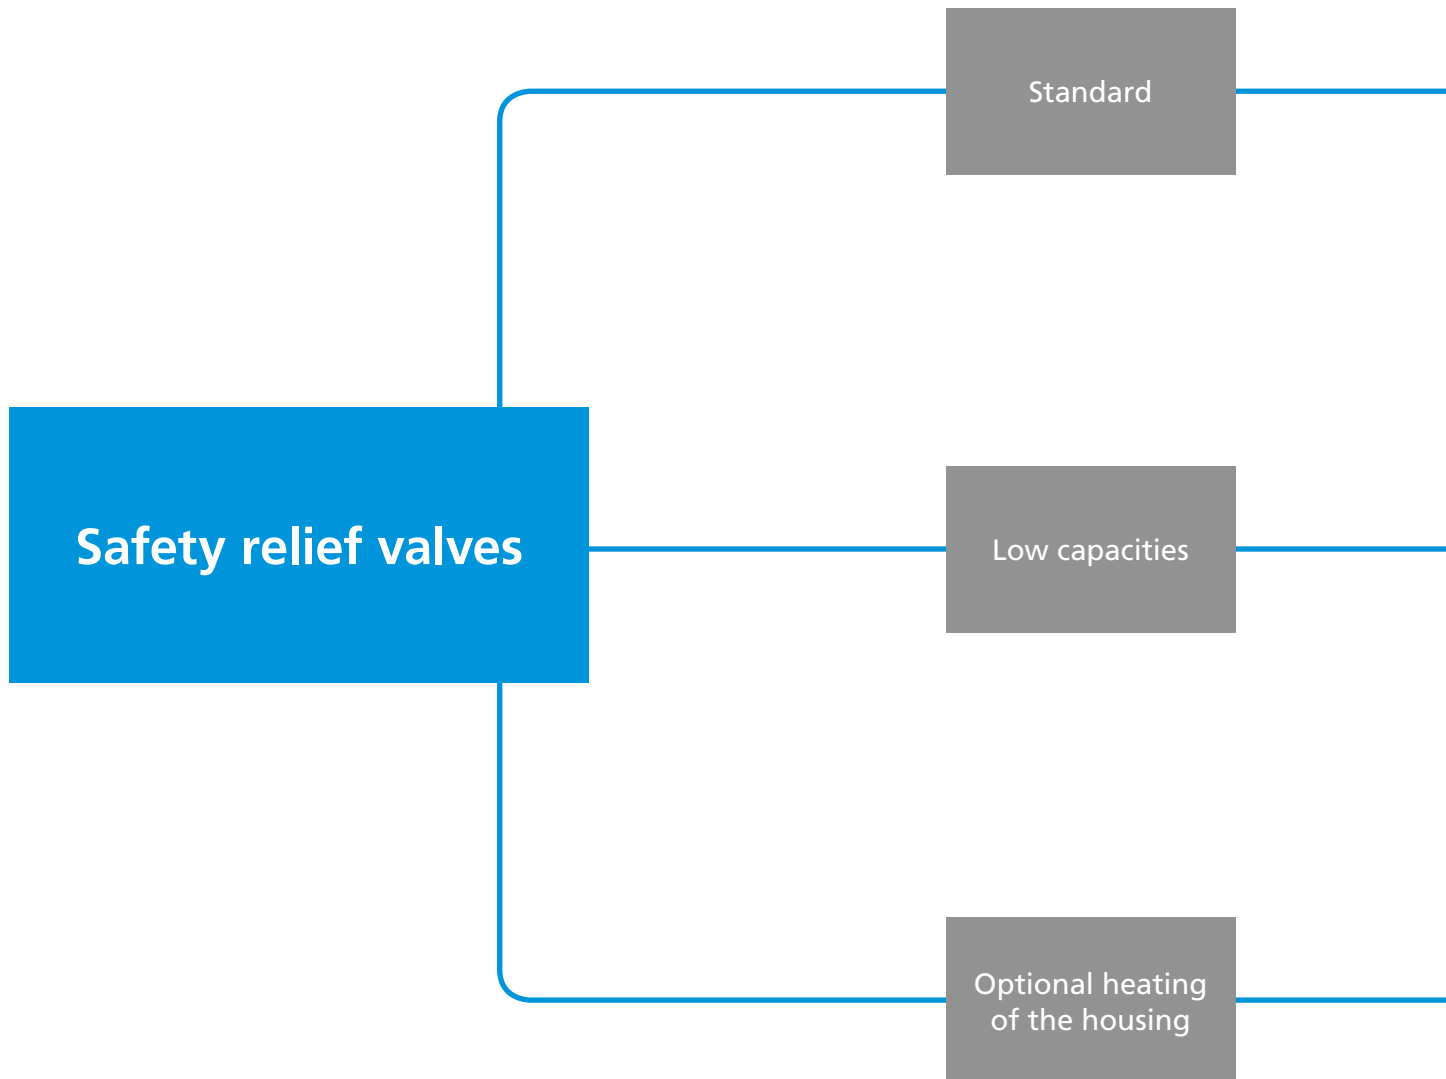

Single piston lifting in the VARIVENT® safety valve types 488 and 483

Double piston lifting in the VARIVENT® safety valve types 488 and 483

Surface quality

Deviating from the quality of the standard surface quality ($R_a \leq 0.8 \mu\text{m}$) a surface quality is available up to a medium roughness for surfaces in contact with the product of $R_a \leq 0.4 \mu\text{m}$. The outer surface of the housings is matte blasted as standard.

One process for improving the surface quality is electrochemical polishing, in which peaks on the surfaces of material are abraded by a galvanic process, resulting in an evened-out elevation profile.

This surface treatment makes it much less likely for contaminating substances and micro-organisms to stick to the surface. In addition, the smooth surface improves corrosion resistance by formation of an inert oxide layer.

Available valve types
Type 488
Type 483

Surface quality of the housing inlet in contact with the product	
$R_a \leq 0.8 \mu\text{m}$	Electro-polished
$R_a \leq 0.4 \mu\text{m}$	Electro-polished

Limit stop

The limit stop permits adjustment of the safety relief valve to the required outlet mass flow to avoid an unstable function behavior of the safety relief valve. This additional equipment limits the stroke of the valve and is therefore suitable for best adjustment of the respective valve size to the required capacity to be discharged.

Available valve types
Type 488

Heating facility

The heating facility is used as a freeze protection of the valve seat so that the safety function of the valve is still ensured even at temperatures below 0 °C. The valve housing is equipped with up to two heating rods. Compensation for a temperature differences of up to 30 °C is possible. Overheating of the valve seat must be avoided!

Available valve types
Type HyCom

Cleaning module

The cleaning module serves the hygienic cleaning of the entrance side of an upright safety relief valve. A cleaning connection module is used to spray cleaning media into the seat area of the valve. To use the cleaning module, the safety relief valve must be equipped with the connection fitting VARIVENT® grooved flange.

Comments / Miscellaneous	_____ _____ _____ _____

VARIVENT® vacuum valves

VARIVENT® vacuum valves are used for hygienic protection of tanks against negative pressure. Protection takes place from -2.5 mbar_g . To minimize cleaning and for protection from sticking of the valve disc, the seat ring of the valves has an anti-adhesive coating. The elastomer seals used are FDA-compliant.

VARIVENT® vacuum valves have quick reaction times when vacuum occurs, as well as safe closing functions at excess pressure.

Function of the valve

Hydraulic configuration of GEA Tuchenhausen vacuum valves is always based on prevention of vacuum caused by free emptying of a tank. Prevention of vacuum caused by hot/cold cleaning is not taken into consideration.

If a vacuum occurs in the tank system, the valve disc is lifted by the negative pressure. The inflowing air flows up through the valve from below. This arrangement offers best protection against the percolation of dirt particles into the tank and thus into the product. The valve runs empty.

The functions of the VARIVENT® vacuum valve can be optionally expanded with a proximity switch feedback, a pneumatic lifting mechanism and a heating element.

Application examples

The VARIVENT® vacuum valves are mostly used in combination with the VARITOP® tank safety system. Accordingly, the main application is the beer brewing industry.

The optional installation of a heating element ensures full function even at temperatures below freezing. VARIVENT® vacuum valves therefore can also be operated outdoors. Only protection from weather must be provided.

Special features
Best protection from dirt particles being sucked in
Ideal combination with the VARITOP® tank safety system
Quick reaction times
Additional equipment

4.6

The valve is connected to the housing at the tank system. The valve disc is closed. The coloration in the housing represents the vacuum.

The valve disc is opened by the vacuum; air flows into the system without dirt particles being pulled along.

The code is composed as follows, depending on the chosen configuration:

Position	1	2	3	4	5	6	7	8	9	10	11
Code	V	L		-	L0	-		N	/52	+	

For order codes differing from the standard version, please refer to section 7 (options).

Heating

Heating of the vacuum valve is recommended when ambient temperatures could fall below the freezing point. This ensures that the valve disc does not freeze to the seat. Voltage: 24 V AC, power: 20 W

Pneumatic lifting type A

The pneumatic lifting serves control of the valve disc for valve seat cleaning during tank cleaning. This way, the seat and seal surfaces are cleaned in addition to the valve housing. The lifting mechanism can be retrofitted.

Feedback type E

The proximity switch detects the closed valve position. As soon as the valve disc leaves the non-actuated position the switching contact is interrupted.

Two types of proximity switches are available:

Proximity switch 24 V DC M18x1 for type E	Article number
2-wire (terminal chamber)	505-036
3-wire (terminal chamber)	505-083

Pneumatic lifting actuator and feedback type R

Type R is a combination of the pneumatic lifting actuator type A and the proximity switch type E. The function method is comparable to type A and E.

VARITOP®

The tank safety system VARITOP® is a modular system on the basis of standardized basic components. VARITOP® is used for tank cleaning, to secure against inadmissible excessive and negative pressure and for gassing and degassing of tanks. Each customer may select the respective desired function units. Apart from this, the setup can be structured individually. The result is a functional unit adapted to customer desires.

Filling and emptying

Function of the system

The tank is secured against excess pressure with spring-loaded safety relief valves. VARIVENT® vacuum valves secure against negative pressure. For more detailed information about and the configuration of these valves please see section 4.

A central connection is used to switch gas and CIP paths. The CIP/gas management takes place either via an automatic switch-over module (no power supply required) or via a butterfly valve combination. The cleaning media enters the tank through the CIP line in the module. If no cleaning process takes place, gassing and degassing is ensured by a gas bypass at the cross piece and via the switch-over module.

The tank safety system VARITOP® can be placed on a central connection or a tank dome cover. The interface is always the proven VARIVENT® flange connection on the cross piece.

Application example

In practice, VARITOP® tank safety systems are often used in the brewery industry. A typical application is in the securing of tanks in the fermentation and storage cellar areas. During fermentation and storage, VARITOP® can be used to adjust the pressure in the head space of the tank. At the same time, the VARITOP® system protects the tanks from over- or under-pressure when filling or emptying.

The option of heating the vacuum valve and the safety relief valve permits using the VARITOP® tank safety system outdoors. However, there is the prerequisite that protective measures must be taken, e.g. for adequate protection from weather influences (enclosure).

Special features
Flexibility because of modular principle
Reliability in fully automated processes
Reproducible cleaning result
Securing against excess pressure
Securing against negative pressure

Tank dome cover connection

Advantages of the tank dome cover
More compact design
Additionally expandible
Sight glass with and without illumination
GEA Tuchenhagen level-probe type TNS
VARIVENT® flange connection

Central connection

Advantages of the central connection
Reduced to one connection to the tank
Identical function ensured
More cost-effective version
VARIVENT® flange connection

Design of the central connection

1 Cross piece

The cross piece is the central connection point of the containers. All essential components are installed at the cross piece. The special construction ensures complete cleaning of all connected components.

2 Cleaning lance or rotating jet cleaner

The cleaning lance or the rotating jet cleaner is connected to the CIP/gas management and leads to the tank through the cross piece. Special nozzles additionally clean the cross piece from the inside and the connected components.

3 Safety relief valve

The safety relief valve of type 488 or HyCom secures the tanks reliably against excess pressures. For more detailed information and notes on design, see section 4.5.

**4** Vacuum valve

VARIVENT® vacuum valves secure the tank against a minimum negative pressure of -2.5 mbar_g . The construction of the valve ensures fast reaction times when a vacuum occurs. For more detailed information and notes on design, see section 4.6.

5 Switch-over module of the CIP/Gas management

For more detailed information, see the next pages.

Design of the tank dome cover connection

6 Central connection

For the central connection, the connection to the container takes place via the tried and tested VARIVENT® flange connection. The grooved flange is always provided for at the cross piece.

7 Pressure transmitter

The optional pressure transmitter records the pressure in the head space of the tank above the product. The process connection type VARINLINE® N 50/40 is always present even if no pressure transmitter is provided.

10 Cleaning module

The cleaning module serves the hygienic cleaning of the entrance side of an upright safety relief valve. A cleaning connection at the switch-over module is used to spray cleaning media into the seat area of the valve.

9 GEA Tuchenhausen level probe type TNS

The GEA Tuchenhausen level probe is used as overfill protection at vessel filling. It is fitted right on the tank dome cover.

8 Sight glass valve (with illumination)

The sight glass is available as a selection option for the tank dome cover. Additionally, the sight glass can be equipped with illumination. This is attached on the sight glass.

Automatic switch-over module

Way I: Open

Way II: Open

In the idle position, the switch-over module keeps the path for gassing and degassing of the tank open (path II). The path to the cleaning device is always opened (path I).

During the supply of cleaning media to the cleaning lance, the switch-over module automatically switches at a flow rate of 10 m³/h um and closes path II. The exception is with the use of a rotating jet cleaner where the switch-over module closes at 8 m³/h. The path to gassing and degassing is closed after switching.

Please note the following with the design of the VARITOP®!
The gas capacity is pressure dependent and the maximum is 92 m³/h CO₂ at an operating pressure of 2 bar_g. This can also be converted to other process parameters.

The switch-over module is self-cleaning.

The maximum gas flow into the tank is 145 m³/h at a maximum pressure drop of 0.01 bar.

Butterfly valve (with power supply)

Way I: Closed
 Way II: Open

In the idle position the switch-over module keeps the path for gassing and degassing open. The path to the cleaning device is closed. Pneumatic path switching is provided. After activation the path to the cleaning device is then opened and the gassing and degassing path closed. The switch-over module is designed for higher gas rates.

Butterfly valve with T.VIS® P-15 (with power supply)

Way I: Closed
 Way II: Open

The diversion valve controls the gassing and degassing or the container inner pressure depending on the process parameters. Thus, the pressure can be compactly and reliably controlled e.g. during fermentation. The control valve, designed as a butterfly valve T-smart 7 in combination with a T.VIS® P-15, is provided in path II. Path I is locked with a butterfly valve T-smart 7 in combination with a T.VIS® M-15.

Cleaning of the valves

For the central connection, the safety relief valve and the vacuum valve are cleaned by the cleaning lance or the rotating jet cleaner. The cleaning media is sprayed onto the valve seats through the bores in the lance pipe. To ensure that the valve seats as well as the housings are cleaned, the valve discs can be lifted (optional).

The tank dome cover version has the safety relief valve fitted vertically on the tank dome cover. The valve can be cleaned via a separate cleaning module that is fitted between the tank dome cover and the safety relief valve. For further information refer to the section 4.5.

Internal cleaning

The tank can be cleaned with a cleaning lance or a rotating jet cleaner. For the cleaning lance, spray balls, orbital cleaners and rotating cleaners are available cleaning devices.

The cleaning lance or the rotating jet cleaner is fitted on the top of the cross piece and protrudes into the tank through the cross piece. Nozzles in the lance pipe ensure cleaning of the cross piece during tank cleaning.

The automatic switch-over module closes only starting at a corresponding flow rate (see following pages). This volume flow must be reached or exceeded and may be higher than the necessary flow rate for tank cleaning. The divert valve has cleaning openings that ensure cleaning of the connection pipeline to the cross piece when closed.

Cleaning lance and accessories

Many cleaners from the GEA Breconcherry cleaning technology range can be used with the tank safety system VARITOP®. Technical differences from single use can result. Be aware that the maximum permitted working pressure for all installed cleaners is 10 bar_g.

The cleaning lance is used to adapt the cleaners in the VARITOP®.

Rotating jet cleaner

The rotating jet cleaner has a proven cleaning concept of slow rotation, combined with powerful and targeted blasting to achieve the best cleaning result.

The following cleaners can be used:

Rotating cleaners	Orbital cleaners	Static cleaners
Clipdisc	Tempest	Spray ball
Sanitor	Tornado	Recommended operating pressure is between 1.0 and 2.5 bar _g
Torus	Tornado 4	
Turbo SSB	Typhoon	
Turbodisc	Torrent	

The following nozzle arrangements are available.

Nozzle placement		
A	C4	E1
B	D1	F2
B1	D2	F3
C1	D3	F5
C2	E	

For more information on the individual cleaners, see the cleaning technology catalog.

When using the rotating jet cleaner, we recommend a CIP/Gas management in the form of a butterfly valve combination.

Determination of the cleaning volume flow for the overall system

The required flow rate of cleaning media is composed of three different parts. First, the flow rate for the cleaner is determined. Second, the flow rate for the internal cleaning of the systems is determined. If required, a share from using the automatic switch-over module is added. To give an illustrative example, we will present the calculation based on a spray ball type A2 and a cross piece DN 162.

1. Cleaner

Read the flow rate for the cleaner at the desired working pressure; see catalog Cleaning Technology.

Example: Spray ball A2 (1 bar_g): $\dot{V}_{\text{cleaner}} : 21.9 \text{ m}^3/\text{h}$

Important: If the spray balls are used at a higher pressure than 1 bar_g, the flow rate changes (see catalog Cleaning Technology)

2. Determination of the flow rate for the internal cleaning in the VARITOP®

Example: Cross piece DN162

$$\dot{V}_{\text{cleaning lance}} = K_{vs \text{ -value}} \cdot \sqrt{\frac{P}{1} \frac{\text{bar}_g}{\text{bar}_g}}$$

$$\dot{V}_{\text{cleaning lance}} = 2.3 \cdot \sqrt{\frac{1.0}{1} \frac{\text{bar}_g}{\text{bar}_g}} = 2.3 \frac{\text{m}^3}{\text{h}}$$

Cleaning flow rate of the internal cleaning			
Nominal width of the cross piece	DN 100	DN 125	DN 162
Kvs values [m ³ /h]	0.93	1.88	2.30

3. Determination of the overall volume flow

a) For the disc switchover:

For all cleaners:

$$\dot{V}_{total} = \dot{V}_{cleaner} + \dot{V}_{cleaning\ lance}$$

Example: For the spray ball A2 at 1.0 bar_g in a cross piece DN 162 with disc valve switchover:

$$\dot{V}_{total} = 21.9 \frac{m^3}{h} + 2.3 \frac{m^3}{h} = 24.2 \frac{m^3}{h}$$

b) Exception for automatic switch-over module

The automatic switch-over module consumes the flow rate for self-cleaning: $\dot{V}_{Auto. Switch-over\ module}$

This is determined based on the following chart and results from the pressure at the cleaner.

Thus, the overall volume flow is composed as follows:

$$\dot{V}_{total} = \dot{V}_{cleaner} + \dot{V}_{cleaning\ lance} + \dot{V}_{switch\ module}$$

Additionally, the automatic switch-over module requires a **minimum volume flow of 10 m³/h** for the divert function independently of the cleaner.

Exception: Rotating jet cleaners always close at 8 m³/h.

Case 1:

- ≤ 8 m³/h for rotating jet cleaners
- ≤ 10 m³/h for all other cleaners

The calculated flow rate is not enough to close the automatic switch-over module.

Case 2:

- > 8 m³/h for rotating jet cleaners
- > 10 m³/h for all other cleaners

The calculated flow rate is enough to close the switch-over module.

Example: For the spray ball A2 at 1.0 bar_g in a cross piece DN 162 with automatic switch-over module:

$$\dot{V}_{total} = 21.9 \frac{m^3}{h} + 2.3 \frac{m^3}{h} + 0.65 \frac{m^3}{h} = 24.85 \frac{m^3}{h}$$

Special flange for cleaners with larger installation opening

The special flange is used for cleaners that require an access opening larger than the nominal width of the cross piece. To permit installation of such cleaners from the outside, an enlarged flange is attached to the cross piece. The cleaner is first fitted to the cross piece and then installed at the tank as one unit. For overproportional cleaners, the special flange is selected automatically.

This version is only possible in combination with the tank dome cover (D).

The special flange is fitted on the tank dome cover. The mounting opening and the outer diameter of the special flange always have the same sizes, as you can see from the dimensional drawing on the left. The connection diameter to the cross piece varies according to the cross piece nominal width.

Nominal width	Diameter of the installation opening
DN 100	213.6 mm
DN 125	213.6 mm
DN 162/IPS 6"	213.6 mm

Pressure transmitter

The pressure transmitter is installed at the cross piece. Gas pressures of 0–4 bar_g or 0–10 bar_g can be measured in the head space of the tank. The process connection type is VARINLINE® N 50/40.

GEA Tuchenhagen level probe type TNS

Evaluation of the GEA Tuchenhagen level probe takes place conductively and can be used for different media. It can be chosen optionally and is fitted into a weld-in adapter on the tank dome cover. For further information refer to the section 1.

Sight glass

The sight glass is available as a selection option for the tank dome cover. Additionally, the sight glass can be equipped with illumination.

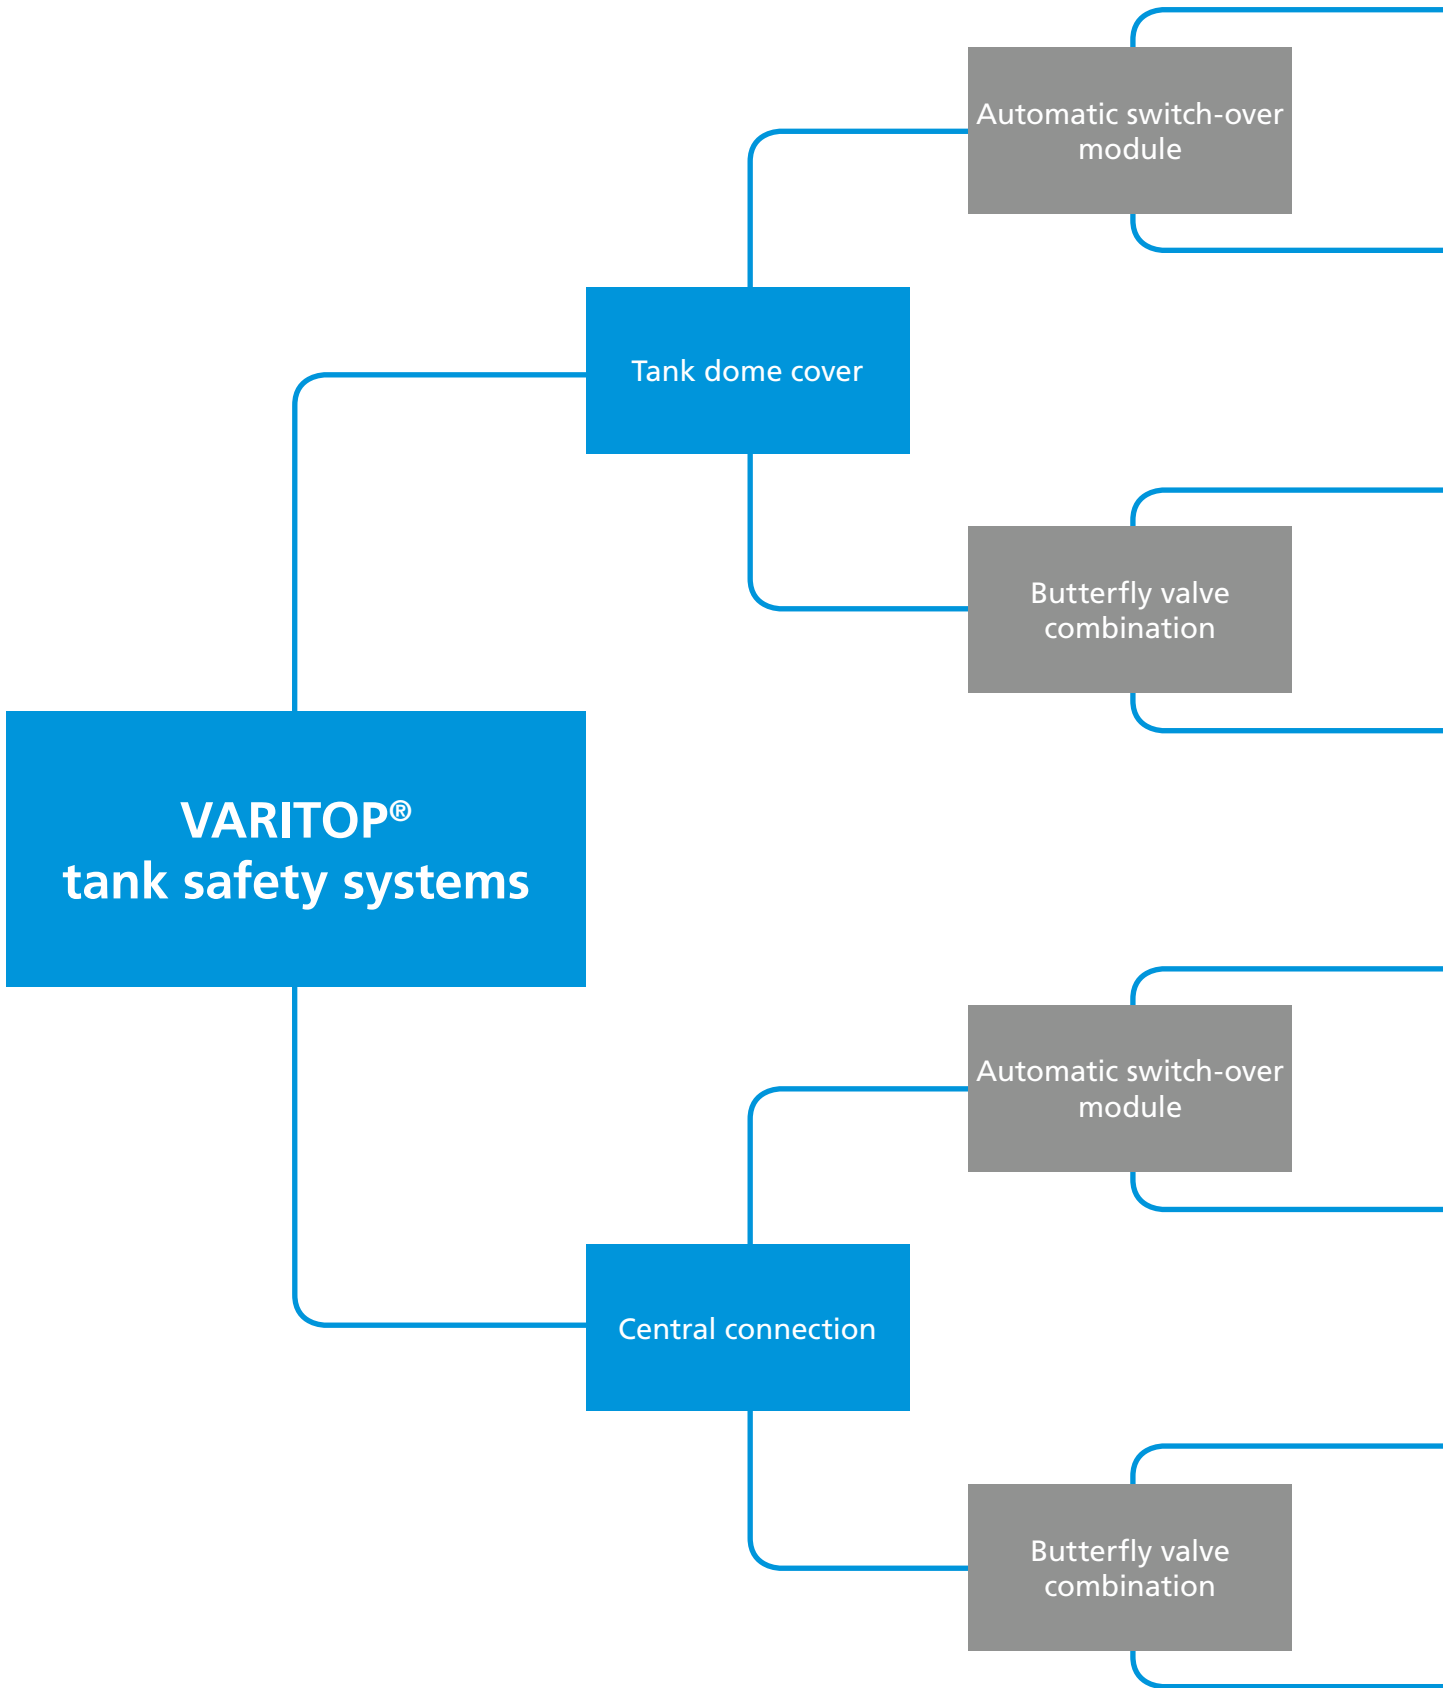

Cleaning module

The cleaning module performs the hygienic cleaning of the entrance side of an upright safety relief valve. It is installed between the tank dome cover and the safety relief valve. A cleaning connection at the switch-over module is used to spray cleaning media into the seat area of the valve.

For further information refer to the section 4.5.

Technical data of the standard version	
Material in contact with the product	1.4404
Seal material	EPDM
Ambient temperature	0 to 45 °C
Operating temperature	< 60 °C

VARICOVER® product recovery systems

Product recovery systems optimize the economic efficiency of a process system by recovering the valuable products from pipelines.

Pigging pushes the remaining product from the pipe and returns it to the production cycle. The thin product film is easy to remove by subsequent cleaning, so that the pre-flushing time can be reduced.

Recover the value, reduce the waste!

Special features

- Design with no dead zones
- CIP/SIP-able
- Reduced product loss
- Reduced cleaning media and water consumption
- Reduced waste water load
- Reduced production downtimes
- Simple maintenance

Application ranges

Product push-out

Product recovery systems are used for the ejection of viscous / flowing products from pipelines without mixing with any other media. This is especially required for high quality products in the food and beverages industries, as well as, pharmaceutical and personal and health care industries.

Product control

In addition to pushing out of products from the pipelines, product recovery systems are also used for gentle filling of pipelines with sensitive and foaming products. Even vertical pipelines can be easily filled by letting the product push the pig downwards in the pipe.

Applications

Personal and health care industry

- body care
- shampoo, lotion, cream
- toothpaste
- cleaning media, washing agents, softeners

Food industry

- yogurt, quark, cheese
- fruit juice
- dough, vegetable oil
- sauce, ice cream

Beverage industry

- concentrate
- syrup

Types of product recovery systems

The pigging process can be implemented with different degrees of automation. That is why the portfolio of GEA Tuchenhagen offers three different product recovery systems:

1. Automatic product recovery systems

Due to the complete automation of the process, the pig can push out and be cleaned without manual action. The entire process takes place solely in the pipeline.

Special features

Safe operation by closed pipe systems

No pig removal required in operation

Automatic function mode and thus fully verifiable processes

Components certified to 3A (101-00)

2. Semi-automatic product recovery systems

In contrast to the automatic product recovery systems, with the semi-automatic product recovery systems the pig is inserted and removed manually. Pushing out of product and returning of the pig then takes place automatically.

3. Manual product recovery systems

In the manual product recovery system, the pig is manually inserted into the pipeline and at the end removed manually. The pig runs in only one direction.

Design of a product recovery system

A VARICOVER® product recovery system usually comprises of a pig cleaning station, a pig catching station with propellant medium valves, and a pig. The pig is placed in the pig cleaning station during production and cleaning. In the pig catching station, the pig is stopped mechanically after successful product push-out and the propellant medium valves are used for propellant medium supply (air/water).

The pig components can be installed either in new systems or integrated into already present process systems.

Arrangement of the components in the product recovery system EMI/1

Features of VARICOVER® product recovery systems

VARICOVER® product recovery systems are characterized by use in fully automatic operations at maximum cleaning demands. Safe operation is secured by a firmly installed and closed pipe system so that no dismantling of the pig cleaning station is required for operation and cleaning. That is why the automatic function mode corresponds to a process that can be validated.

Detection of the pig position via magnetically inductive proximity switch – from the outside of the pipeline – permits automatic control and cleaning (CIP) of the product recovery system.

The pig driving medium can be water, air, CO₂ or N₂.

Cross-section of the housing of the pig cleaning station

Applications in process systems

Product recovery systems are used in different applications to meet the various requirements in numerous industries and processes:

- From product acceptance to pre-phase tanks
- From pre-phase tanks to mixers/process tanks
- From mixers/process tanks to storage tanks
- From storage tanks to filling machines

Pig stopper with pig

Prerequisites for operating of product recovery systems

- Fluid products suitable for pumping
- Non-sedimenting products
- No installations protruding into the pipe in the section to be pigged, such as measuring mountings
- Only piggable valves matching the geometry of the GEA Tuchenhausen double ball pig can be used
- Same interior diameter throughout the pipe system
- No sharp-edged and strongly sagging welds
- Connection fittings with transfers rounded on the inside can be used
- No seals protruding into the pipe permitted
- Standard pipe bends with small middle radius can be used – minimize number of pipe bends
- Use pipe bends with low ovality – Tolerances up to $\pm 1.5\%$ referring to the outside diameter across the entire bend length

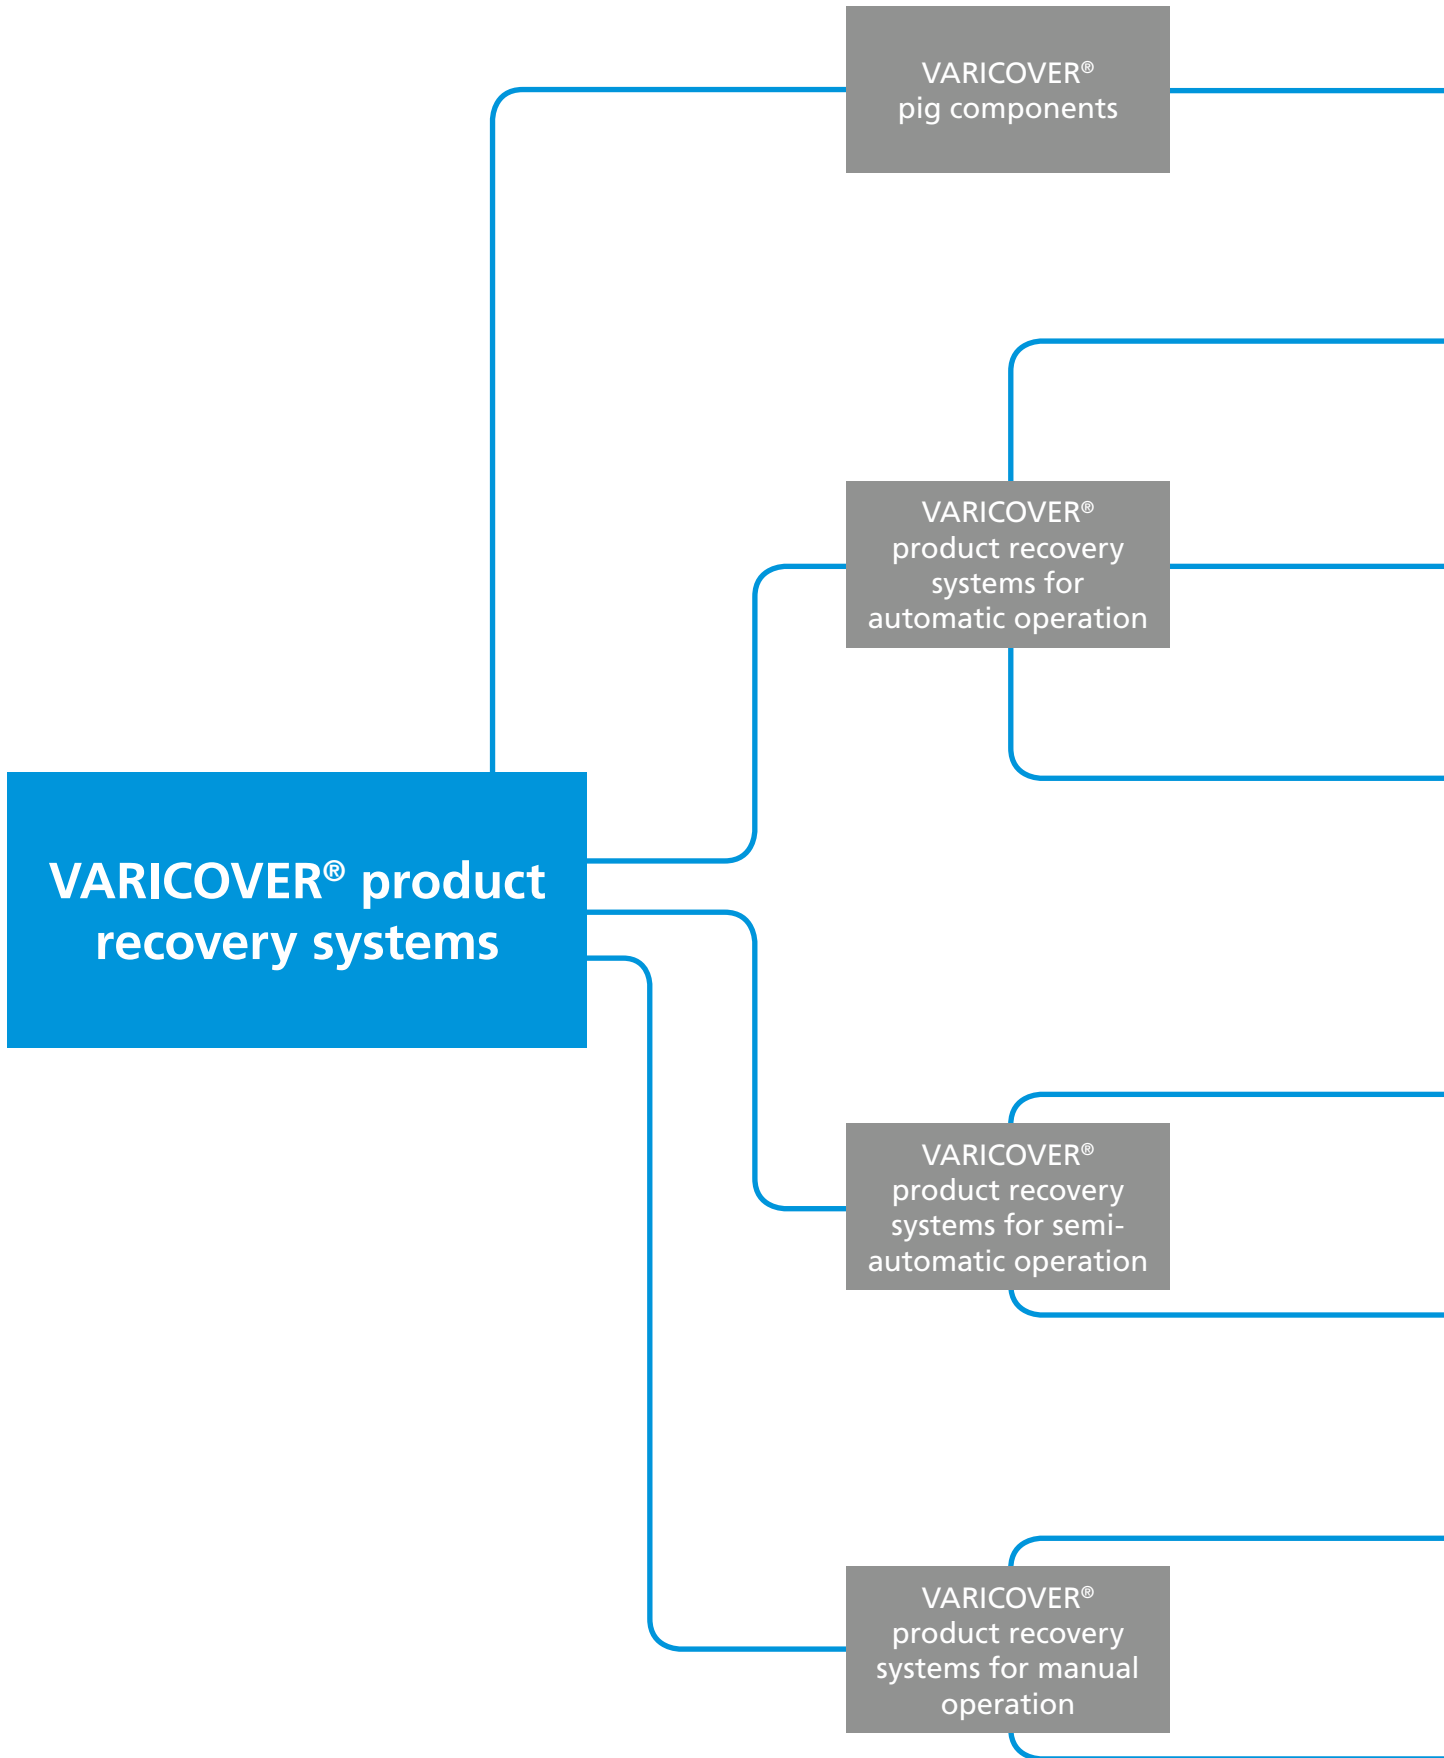

Process system recommendations

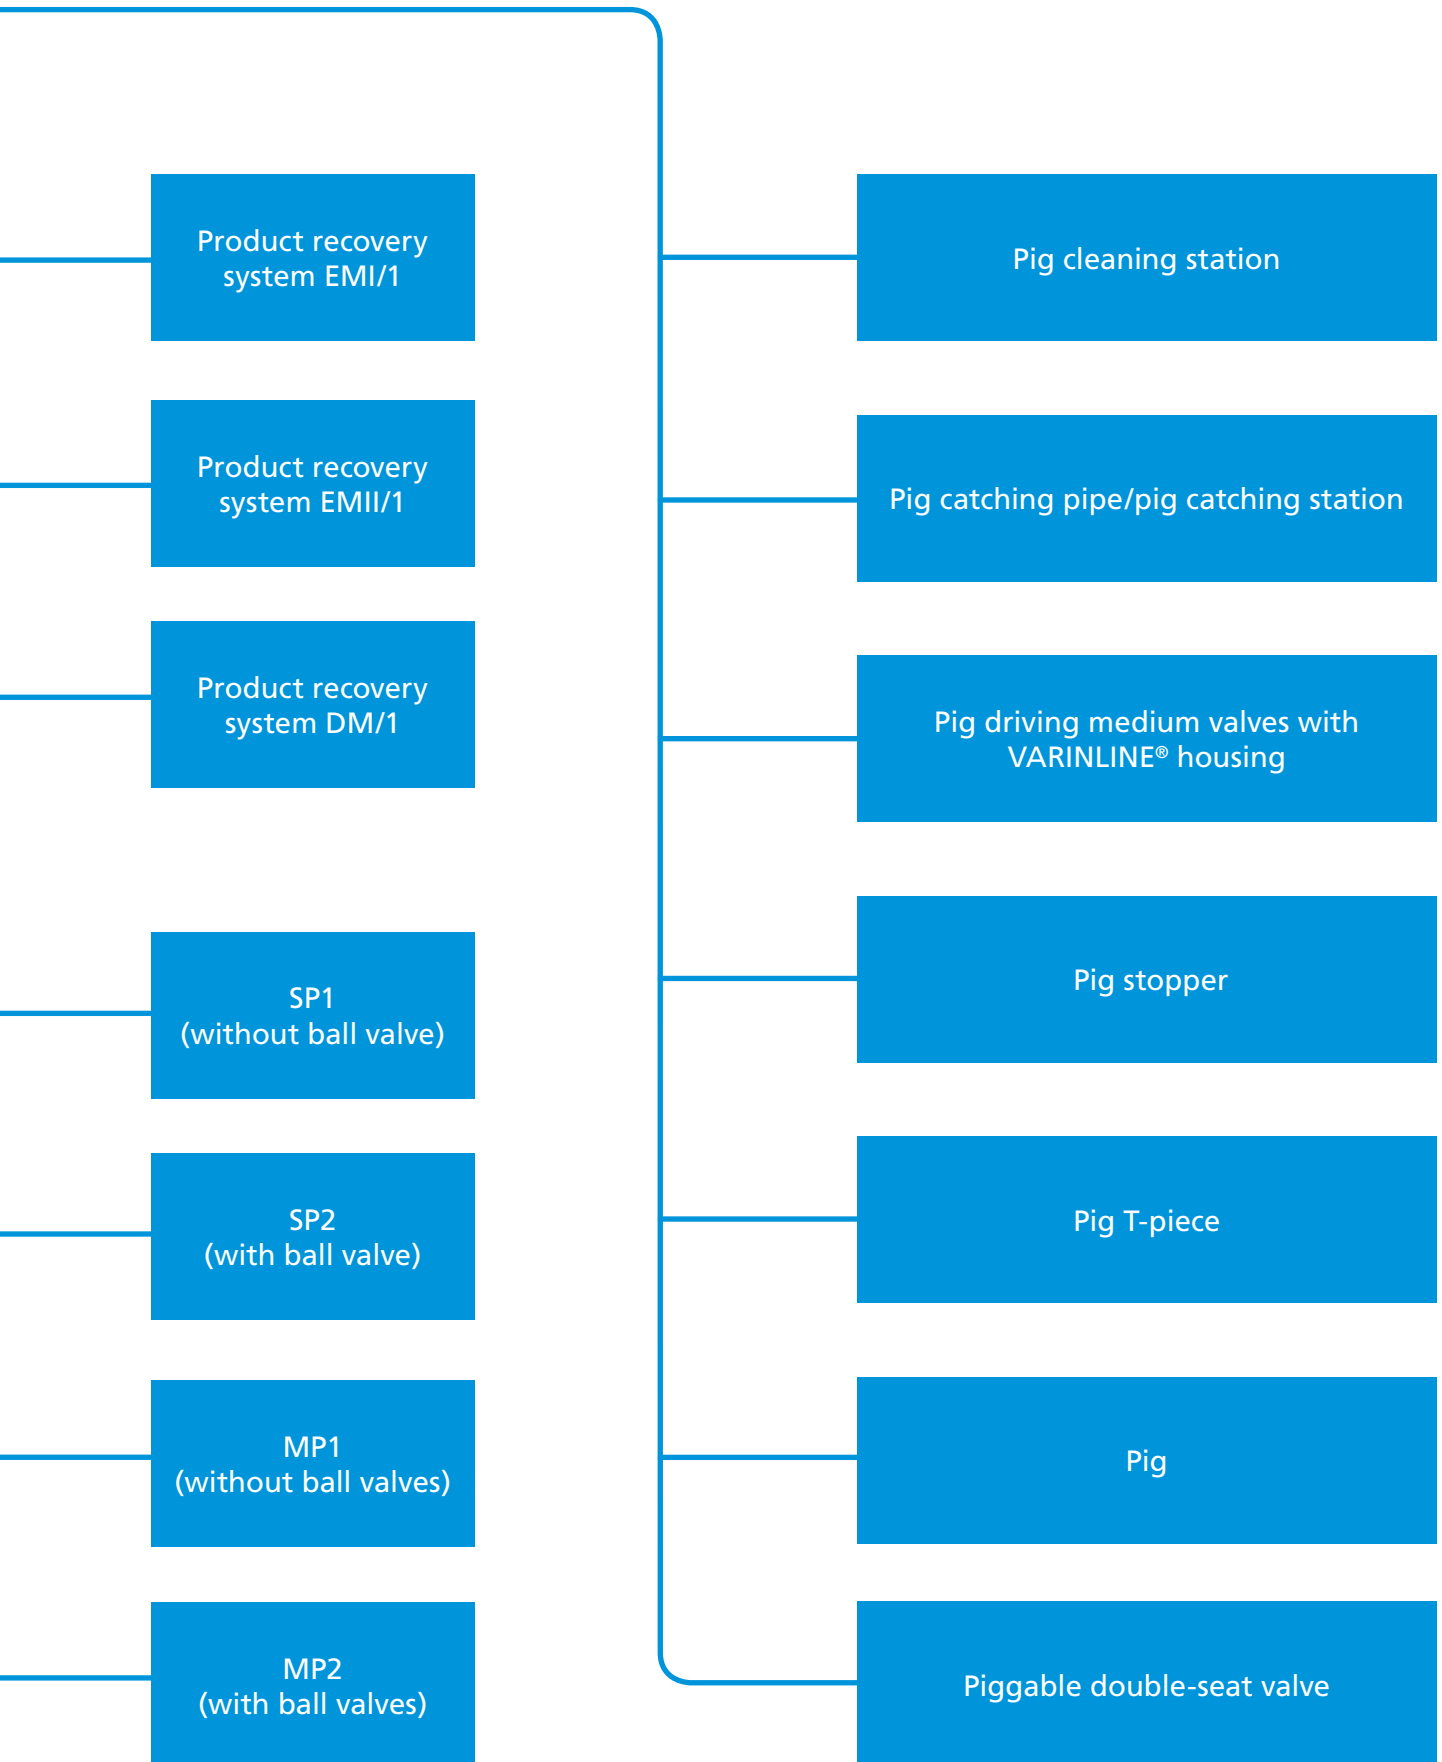

The pig speed control is important for the successful operation of a product recovery system. It must not exceed 0.5 m/s when reaching the pig station. If the arrival speed is too high, there is the danger of damage to the pig.

When using compressible media, such as air, before and behind the pig, the following applications must be avoided:

- running the pig in a dry pipeline
- returning the pig after pushing out water

If these applications are not observed, there is the danger of a “stick-slip effect”. Here, the pig moves jerkily through the pipeline and may reach too high of speeds. An exception of this effect are with very slippery products such as shampoo and vegetable oils that form a sufficient lubricating film between the pig and the pipe wall.

Function method of the pig cleaning station

The pig cleaning station, free of dead zones and completely CIP-/SIP-able, is integrated into the product path and is flexible for use as the launching or receiving station. The pig retention cylinders and guidance keeps the pig firmly in position in the station during flooding with product or cleaning media. The flow direction through the station is irrelevant.

When receiving or launching the pig, the pig gripper is pushed forward. The pig is half gripped by the gripper rods, so that it securely reaches the retracted position for production or cleaning.

When the pig is flooded with product, there is a continuous product exchange in the pig station housing. The product is gently transported through the housing. This is possible since the flow area around the pig corresponds to that of the pipeline. Since the housing is free of dead zones without domes and sumps, this ensures the best cleaning with complete residual emptying.

Cleaning the pig in the pig cleaning station

During cleaning, the pig remains in the pig cleaning station. Only there can it be flooded completely. This is possible because the pig gripper moves forward and backward several times by the control of the actuator so that a gap results between the pig front and the metallic stop.

Complete cleaning of the pig in the pig cleaning station

Furthermore, the pig can move between the gripper and the guidance rods, so that the pig contract points to the rods are completely cleaned.

Design of the pig cleaning station

1 Pig retention cylinder

The pig retention cylinders fasten the pig in the pig cleaning station in their spring-to-close position and release the pig after pneumatic activation. They are controlled via the T.VIS® feedback system.

2 Pig station housing

Product and cleaning media flood the pig firmly held in position in the pig station housing. Continuous monitoring of the pig position from outside of the housing is possible via the two magnetic sensors. Different connection fittings are available optionally.

3 Pig gripper

The pig gripper takes the pig on one side so that it will reach different positions safely.

4 Pig guidance

The pig is guided by straight rods within the pig station housing and thus cannot take an inclined position in the pig station housing which has a larger diameter than the pig.

5 Lantern

The open design of the lantern separates the actuator and product parts from one another. It permits visual inspection of the stem seal, and is also used for indicating any leakages. Furthermore, a heat transfer between the pig station housing and the pig actuator is prevented.

6 Pig actuator

The pig actuator consists of an air/air controlled actuator used for moving the pig into the production/cleaning position respectively into the launching/receiving position.

Pig catching pipe/pig catching station

In the catching pipe, the pig is stopped mechanically. It cannot be flooded with cleaning media there and leaves the station right after arriving in most applications. The mechanical pig stop which is integrated in the catching pipe is thoroughly cleaned during the pipe cleaning.

The catching pipe is used with and without the welded-on pig driving medium valve. The standard valve unit consists of two combined ECOVENT® valves of types NL and WK. The NL valve is used for shut-off from the product pipe and the WK valve serves as a divert valve between the inlet of the pig driving medium at the upper housing and the connection to the vent at the lower housing.

This arrangement ensures a complete cleaning of the NL shut-off valve. Furthermore, mixing between the product and the pig driving medium – in case of possible leaks – is prevented by the open venting socket at the WK divert valve.

When air is used as the pig driving medium, an air throttle valve is always installed at the inlet socket of the WK divert valve. It sets the average pig speed by a hand-actuated adjustment of the flow area.

Pig catching pipe

Pig catching station

Cross section pig catching station

Pig driving medium valves with VARINLINE® housing

The VARINLINE® housing permits, aside from the connection of the pig driving medium valves, the adaptation of a pressure gauge, or a pressure transmitter, to record the driving medium pressure during commissioning.

The standard valve unit also consists of two combined ECOVENT® valves of types NL and WK. The NL valve is used for shut-off from the product pipe and the WK valve serves as a divert valve between the inlet of the pig driving medium at the upper housing and the connection to the vent at the lower housing. This arrangement ensures a complete cleaning of the NL shut-off valve. Furthermore, mixing between the product

and the pig driving medium – in case of possible leaks – is prevented by the open venting socket at the WK divert valve.

When air is used as the pig driving medium, an air throttle valve is always installed at the inlet socket of the WK divert valve. It sets the average pig speed by a hand-actuated adjustment of the flow area.

VARINLINE® housings

VARINLINE® housings with pig driving medium valves

Design pig stopper

In the spring-to-close position of the pig stopper, a rod travels over the entire pipe cross section. In it, the pig is stopped mechanically. Product or cleaning media can flow through the free cross-section around the rod.

In contrast to the closed position, the stopper rod is retracted in the air-to-open condition, so that the pig can pass the stopper.

The housing of the pig stopper is screwed to a VARIVENT® grooved flange on both sides and the complete pig stopper is welded into the pipeline.

Both the closed and the opened positions are monitored by proximity switches.

Function method pig stopper

The pig stopper is automatically operated and mostly used for two applications.

Filling and emptying of tanks is often performed by tee-outlets into pipelines. Pig stoppers can be placed before or behind tee-outlets and serve as precise positioning of the pigs. When a pig reaches a stopper rod, it works as a shut-off element and prevents further filling of the line.

In the product recovery system EMII/1, the product is supplied through the lateral socket of the T-piece and the pig stopper prevents the pig from leaving the launching station if any vacuum occurs.

Pig stopper

Cross section pig stopper with pig

Cross section pig stopper with opened stopper rod

Cross section pig stopper with closed stopper rod

Pig T-piece

Special T-pieces in pigging lines are used as product inlet and outlet.

For the pig to be guided well in the T-piece, the pull out of the lateral socket is one nominal width smaller than the main line. This prevents canting of the pig.

The pig T-piece is used to feed product and cleaning media into the product recovery system EMII/1.

Pig in T-piece

Arrangement of the components in the product recovery system EMII/1

Pig

The pig is an inherently stable body made from wear- and temperature-resistant, product compatible material. Its contours allow reliable cleaning of the entire surface. The double ball shape of the pig ensures an optimal passage through small and large pipe bends as well as T-pieces with a reduced lateral pull out. Either running direction is possible.

Inside the pig, there are two stainless steel-encapsulated permanent magnets that permit detection of the pig with a magnetic sensor.

Available pig materials are Silicone and FKM (both FDA, 3A (18-03) and EU VO 1935/2004 compliant).

Separation of two different media

Both running directions possible

Passage of piggable T-pieces

Pigging pipe bends

VARIVENT® double-seat valve type L

The piggable double-seat valve type L is used when different products must be separate from each other and fully mixproof at pipeline junctions and the valve should at the same time be piggable.

Only the lower valve housing with double horizontal ports is piggable, while the upper housing can have one or two horizontal ports. The upper and lower housings are always welded to each other.

Similar to the double-seat valve type R, type L also has the upper valve disc with an axial and the lower one with a radial seal. The double-seat valve type L cannot be equipped with a balancer in the lower housing to protect against pressure hammers.

The double-seat valve type L can be installed in the standing or suspended position. When suspended, the valve opens nearly without any switching leakage, while switching leakage occurs in the standing position. The switching leakage escapes from the additional emptying valve that is between the housings.

The emptying valve pneumatically connected to the actuator is opened while the valve is closed and closes when activating the actuator.

In the standing installation orientation of the valve type L, the cleaning media drains from two ports at the same time – through the port above the housings and through the emptying valve.

For more detailed information on the VARIVENT® valve type L, see the catalog Hygienic Valves VARIVENT® and ECOVENT®.

Launching station

Functional description

Production

The pig is firmly held in position in the launching station and flooded with product.

Product push-out

The pig is pushed through the pipeline by means of the driving medium and pushes the residual product towards the receiving station.

Pig return

When reaching the receiving station, the pig is immediately returned to the launching station.

Cleaning

The pig stations are cleaned during the pipe cleaning. The pig is fully flooded in the launching station and cleaned.

Selection criteria for the product recovery system EMI/1

The product recovery system is automatically operated and the pig is cleaned in the launching station. The pig is removed from the pipeline for inspection.

Preferred combination of the pig driving media

Launching station: Water

Receiving station: Air

At least one liquid medium is before or behind the pig in each pig run.

Combination of the pig driving media

Launching station: Air

Receiving station: Air

This is only possible with very slippery products such as shampoo and vegetable oils that form a sufficient lubricating film between the pig and the pipe wall. Not applicable for products that do not lubricate, so to avoid the "Stick-slip effect".

The pipeline can be fully self-drained after cleaning.

Functional description

Production

The pig is firmly held in position in the pig catching pipe of the launching station and the product enters the system via the lateral socket of the special T-piece. The pig stopper prevents the pig from exiting the system if a vacuum occurs.

Product push-out

The pig is pushed through the pipeline by means of the driving medium and pushes the residual product towards the receiving station. For subsequent cleaning, the pig remains in the receiving station.

Cleaning

The pig stations are cleaned during the pipe cleaning. The pig is fully flooded in the receiving station and cleaned. The system must not be sterilized with steam, because the pig cannot be driven back along a dry line.

Pig return

At the end of the cleaning, the pig is driven back to the launching station by a gaseous driving medium. On its way back, the pig is pushing out the final rinsing water from the pipeline.

Selection criteria for the product recovery system EMII/1

The product recovery system is automatically operated and the pig is cleaned in its specific receiving station. The pig is removed from the pipeline for inspection.

Preferred combination of the pig driving media

Launching station: Air

Receiving station: Air

One liquid medium is located before the pig in each pig run.

Applicable for products with low lubrication properties

Applicable for pipelines that do not self-drain. The pig pushes the water from the last cleaning step out towards the launching station.

The pipeline is not sterilized with steam.

Pig station S1

Pig station S2

Functional description

1. Product push-out optionally in two directions

Production

The pig stations have one pig firmly held in position each. Both are flooded with product in their stations.

Product push-out

After the production end, the residual product may be pushed out in the desired direction using the driving medium. The pig moves to the opposite pig of the receiving station for this.

Pig return

When reaching the receiving station, the pig is immediately returned to the launching station.

Cleaning

The pig stations are cleaned during the pipe cleaning. The pigs are fully flooded in their specific stations and cleaned.

2. Product filling with slope

If the product is filled into empty and descending pipelines, product and air may mix and produce foam.

This incident can be avoided using the product recovery system DM/1. For this purpose, pig S2 is driven against pig S1 prior to production start. Afterwards pig S2 is pushed back with product into its station and serves as a separator between product and air. All further process steps are the same as described before under section 1.

3. Operation with the pig

Only one pig is used in the system. The function method is the same as for the product recovery system EMII/1. In contrast to the EMII/1, no T-piece is used for product infeed. The product enters directly via the launching station and floods the pig firmly held in position.

Selection criteria for the product recovery system DM/1

The product recovery system is automatically operated and the pigs are cleaned in the pig station. The pigs are removed from the pipeline for inspection.

Three possible applications:

- Product push-out optionally in two directions
- Product filling with slope
 - particularly when having foaming products
- Operation with one pig
 - benefit as compared to EMII/1: Product infeed without T-piece

All combinations of driving media can be used if at least one liquid medium is located before or behind the pig in each pig run.

Functional description

Production

Before starting production, the pig is manually inserted in the launching station. The pipe bend is removed for this and then installed again. Product infeed takes place via the lateral socket of the T-piece.

Product push-out

The pig is pushed through the pipeline by means of the driving medium and pushes the residual product towards the receiving station.

Pig return

When reaching the receiving station, the pig is immediately returned to the launching station.

Cleaning

The pig is removed manually before the start of cleaning at the launching station and manually cleaned outside of the system.

Selection criteria for the product recovery system SP1/SP2

The product recovery system is semi-automatically operated, since the pig runs automatically and cleaning of the pig takes place manually.

SP1: without ball valve

SP2: with ball valve

The ball valve increases operational safety when inserting and removing the pig.

Preferred combination of the pig driving media

Launching station: Water

Receiving station: Air

At least one liquid medium is located before or behind the pig in each pig run.

Combination of the pig driving media

Launching station: Air

Receiving station: Air

This is only possible with very slippery products such as shampoo and vegetable oils that form a sufficient lubricating film between the pig and the pipe wall.

Functional description

Production

Before starting production, the pig is manually inserted in the launching station. The pipe bend is removed for this and then installed again. Product infeed takes place via the lateral socket of the T-piece.

Product push-out

The pig is pushed through the pipeline by means of the driving medium and pushes the residual product towards the receiving station. It is removed for subsequent cleaning there and not pushed back to the launching station.

Cleaning

The pig is manually cleaned outside of the system.

Selection criteria for the product recovery system MP1/MP2

The product recovery system is manually operated, since both the pig runs and the cleaning of the pig take place manually.

MP1: without ball valves

MP2: with ball valves

The ball valves increase operational safety when inserting and removing the pig.

Preferred pig driving medium at system MP1

Launching station: Air

When using water, there is the danger of water escaping when opening the pipe bend at the receiving station.

Preferred pig driving medium at system MP2

Launching station: Water

Using water permits better adjustment of the pig speed than with the compressible medium of air. There is no risk of water escaping since the ball valve before the receiving station is closed when opening the pipe bend.

Alternatively, the MP1 and MP2 systems can also be operated semi-automatically. For this, the valves are equipped with pneumatic actuators. The pig run takes place automatically and the pig is cleaned manually. As for the manual application, the pig is taken out at the receiving station.

Pig detector

The pig detector serves to find an unmoving pig along the pipeline or in a pig station. For this, the detector is manually routed to the pipeline from the outside. Once it has entered the area of the pig's magnetic field, an indicator light comes on. The design of the pig detector is comparable to that of a pen. The detector is also approved for use in potentially explosive atmospheres (ATEX and FM).

Article number
228-000358

Pig test material

Using pig test materials helps to determine the chemical resistance of the pig material against products and/or cleaning media in the planning stages.

This procedure is particularly recommended when the resistance of the pig material is unknown. The test bodies have a diameter of approx. 40 mm and a thickness of approx. 4 mm. During resistance tests, deviations from the surface properties, dimensions and weights can be found. Available materials: Silicone and FKM.

Material	Article number
FKM	228-000259
Silicone	228-000260

Magnetic sensor with pipe bracket

Pigs are often detected along pipelines in the running state to initiate measures to reduce the pig speed. For this, magnetic sensors are attached to pipe brackets. They can be fitted anywhere at the pipeline.

Basic data (these parameters refer to the pipeline)

Prerequisites	The same pipe interior diameter across the entire pigging route. • No sharp-edged and strongly sagging welds. • No installations such as measuring mountings in the piggable area. • Standard pipe bends with small middle radius can be used. Recommendation: Minimize the number of pipe bends! • Use pipe bends with low ovality. Tolerance maximum $\pm 1.5\%$ referring to the outside diameter.

Typical application and description

For keeping chocolate or margarine fluid and for cooling ice cream.

For heating or cooling products, a hot or cold medium is passed through the housing jacket in the opposite flow direction.

The product range includes jacketed valve housings with both one and two vertical ports. However, the housings cannot be supplied for valves with mix-matched nominal widths or a welded seat ring.

Typical application and description

For static use of valves with increased product pressure. For increasing the strength, the half rings on the valve housings are made of cast material and the housings with nominal widths DN 100/OD 4" are made of a higher-quality material.

IMPORTANT: The differential pressure between the product chambers on both sides of the valve disc is not allowed to exceed 10 bar during switching of the valve. The actuator size of the valve must be selected based on the product data.

* According to valve type

Typical application and description

Many mix-matched housings are already available.

For technical reasons, however, a mix-matched combination is not possible for all valve types! If required, please contact GEA Tuchenhausen to ask about the feasibility.

The first mentioned nominal width indicates the upper valve housing, the second one is the nominal width of the lower valve housing. In divert valves, both upper housings are configured with the same nominal width. The larger housing in the mix-matched combination must always be configured as a housing with two vertical ports.

Typical application and description

Perfluorinated rubber (FFKM) is an elastomer that is used in areas where particularly high thermal and/or chemical resistance properties are required.

FFKM seal material combines the chemical properties of PTFE and the mechanical properties of Viton, and is characterized by a wide range of application temperatures, very good resistance to fluids, low-pressure deformation and minimum swelling.

* According to valve type

Typical application and description

Deviating from the quality of the standard surface quality (** DN/OD corresponding to $R_a \leq 0.8 \mu\text{m}$; *** IPS corresponding to $R_a \leq 1.2 \mu\text{m}$), different surface qualities are available up to a medium roughness for surfaces in contact with the product of $R_a \leq 0.4 \mu\text{m}$. The outer surface of the housings is matte blasted as standard. Optionally, it can also be supplied ground.

Housings that should comply with the 3-A standard are produced as standard with an inner surface of $R_a \leq 0.8 \mu\text{m}$ with ground welds and a blasted outer surface. If a configuration with a ground outer surface is required, it is necessary to select not only option /3-A (position 13) but also the corresponding surface quality 3 (position 11).

Incorporation of the option in the order code and example

Code	Q	E	W	- DN 80/DN 80 -	M	M3	- L0 -	1	- 2	N	/52	+ 0 0 0 0 0 M

* According to valve type

Typical application and description

One process for improving the surface quality is electrochemical polishing, in which peaks on the surfaces of material are abraded by a galvanic process, resulting in an evened-out elevation profile.

This surface treatment makes it much less likely for contaminating substances and micro-organisms to stick to the surface. In addition, the smooth surface improves corrosion resistance by formation of an inert oxide layer.

Valves with one housing and vertical port

Typical application and description

The valve housings can be specified with a welded-on connection fitting. To find which connection fittings are available, please refer to the list on the following pages.

If the vertical ports within a valve do have different configurations, please inform us of the designation for the particular housing port including the required connection fitting (as in the example below). The seal which may be included corresponds to the sealing material of the valve.

Valves with two housings

Connection fittings	
TK	VARIVENT® flange connection, groove flange on housing
TN	VARIVENT® groove flange incl. O-ring and connecting parts
TF	VARIVENT® flange
GK	Pipe fitting, DIN 11851, male end on housing
GO	Male end SC, DIN 11851, incl. seal ring G
KO	Liner SD, DIN 11851, incl. groove nut
ASK	Hygienic flange connection, DIN 11853-2

* According to valve type

Typical application and description

An O-ring is used for sealing the VARIVENT® flange connection, and is given a defined compression by a metal stop. The O-ring is also protected by the special geometry of the recess from being pulled out at high flow rates.

The VARIVENT® flange connection (TK) can be ordered either as a complete connection including bolts and nuts (TK) or a groove flange (TN)/flange (TF) as a connection fitting on a vertical port. If a complete connection is ordered as the connection fitting, the groove flange is welded onto the housing. The groove flange (TN) contains not only the O-ring but also the required connecting elements.

Complete connection including bolts and nuts (TK)

Groove flange (TN), including connecting elements and seal ring

Flange (TF)

* According to valve type

Typical application and description

A seal ring G is used for sealing the pipe fitting acc. to DIN 11851. The pipe fitting acc. to DIN 11851 can be ordered either as a complete connection (GK) or male end SC (GO)/liner SD (KO) as a connection fitting on a vertical port. If a complete

connection is ordered on a housing port, the male end is welded onto the housing. The groove flange contains the seal ring G. The liner (KO) contains the groove nut.

Complete connection (GK)

Male end SC (GO), including seal ring G

Liner SD (KO), including groove nut

GK – Complete connection, male end on housing

Available nominal widths		
Metric	DN	10–150
Inch OD	OD	1"–4"

Technical data	
Material	1.4404 (AISI 316L)
Standard	DIN 11851

GO – Male end SC, including seal ring G

Available nominal widths		
Metric	DN	10–150
Inch OD	OD	1"–4"

Technical data	
Material	1.4404 (AISI 316L)
Standard	DIN 11851

KO – Liner SD, including groove nut

Available nominal widths		
Metric	DN	10–150
Inch OD	OD	1"–4"

Technical data	
Material	1.4404 (AISI 316L)
Standard	DIN 11851

* According to valve type

Typical application and description

An O-ring is used for sealing the hygienic flange connection acc. to DIN 11853-2, and is given a defined compression by a metal stop. The O-ring is also protected by the special geometry of the recess from being pulled out at high flow rates. Furthermore, the flange connection is centered by the design shape. The sealing geometry of the hygienic flange connection corresponds to the aseptic flange connection acc. to DIN 11864-2.

The hygienic flange connection (ASK) can be ordered either as a complete connection including bolts and nuts (ASK) or a hygienic groove flange (NFK)/hygienic flange (BFK) as a connection fitting on a vertical port. If a complete connection is ordered on a housing port, the groove flange is welded onto the housing. The groove flange (NFK) contains not only the O-Ring but also the required connecting elements.

Complete hygienic flange connection (ASK)

Hygienic-groove flange (NFK), including connecting elements and seal ring

Hygienic flange (BFK)

ASK – Complete hygienic flange connection

Available nominal widths		
Metric	DN	10–150
Inch OD	OD	1"–4"

Technical data	
Material	1.4404 (AISI 316L)
Seal material	EPDM (FDA), FKM (FDA), HNBR (FDA)
Standard	DIN 11853-2

NFK – Hygienic groove flange, including connecting elements and seal

Available nominal widths		
Metric	DN	10–150
Inch OD	OD	1"–4"

Technical data	
Material	1.4404 (AISI 316L)
Seal material	EPDM (FDA), FKM (FDA), HNBR (FDA)
Standard	DIN 11853-2

BFK – Hygienic flange

Available nominal widths		
Metric	DN	10–150
Inch OD	OD	1"–4"

Technical data	
Material	1.4404 (AISI 316L)

* According to valve type

Typical application and description

The clamp connection acc. to DIN 32676 is a widely used connection fitting, especially in North America. The connection uses a symmetrically structured clamp connection with a seal located in between it, and is secured by a clamp. The second clamp connection, the seal and the clamp are not supplied.

Clamp connection (CO)

CO – Clamp connection

Available nominal widths

* According to valve type

Typical application and description

Optionally, the housings or all parts in contact with the product can be supplied with a test report 2.2 and/or an inspection certificate 3.1 acc. to EN 10204.

IMPORTANT: An inspection certificate for all components in contact with the product can only be produced if notification of this requirement is provided with the order. The inspection certificate 3.1 acc. to EN 10204 can only be issued subsequently for the housings. Unless special requirements are stated, the order code referred to below only covers issuing the inspection certificate 3.1 acc. to EN 10204 for the housings.

European standard EN 10204 in its 2004 edition defines the various types of test certificate that can be issued to the ordering party in accordance with the agreements in the order for delivery of metallic products.

Number	Type of test certificate	Content of the certificate	Confirmation of the certificate by
2.2	Test report	Confirmation of compliance with the order, specifying results of a non-specific test	The manufacturer
3.1	Inspection certificate 3.1*	Confirmation of compliance with the order, specifying results of a specific test	The manufacturer's acceptance officer independent of the production department

* Inspection certificates 3.1 can be selected either for the housing or for product wetted parts connection fittings, incl. connection fittings or ADW2 (please specify when ordering).

Incorporation of the option in the order code and example

* According to valve type

Typical application and description

If no alternative identification option is selected, the valves are always provided with a nameplate for clear identification (option /52). All key information required for clear allocation of the valve, as well as technical data, is specified on the nameplate. The plate is glued onto the actuator. If the required identification number is specified, this is allocated to the valve by means of a separate sticker on the actuator or control and feedback system.

Key data contained	
Valve type	
Serial number	
Materials in contact with the product	Metallic material / seal material
Air supply pressure	Min./Max. [bar/psi]
Product pressure	Housing 1/2/3 [bar/psi]

Option /50 – engraved labeling plate cpl. for system identification number

In addition to the nameplate, the option /50 consists of an engraved labeling plate attached between the actuator and lantern using a key ring on the clamp connection.

Option /51 – metal labeling plate US version cpl.

The engraved labeling plate is attached between the actuator and lantern using a key ring on the clamp connection. Additional information can be recorded as well as the TAG number, customer designation and the valve type. In addition, the valve is identified with a nameplate.

Option /55 – valve identification with TAG number (yellow)

Option /55 consists of a carrier for up to 10 characters made of plastic which is attached to the actuator with cable carriers. For clear identification, the valve is additionally provided with a nameplate.

Option /56 – valve identification with TAG number (yellow)

Option /56 consists of two carriers for up to 10 characters each made of plastic which are attached to the actuator with cable carriers. For clear identification, the valve is additionally provided with a nameplate.

* According to valve type

Typical application and description

3-A Sanitary Standards, Inc. is an independent, non-profit corporation dedicated to advancing hygienic equipment design for the food, beverage, and pharmaceutical industries. In particular, it represents the interests of three stakeholder groups in the US dairy industry with a common commitment to promoting food safety and the public health – regulatory sanitarians, equipment fabricators and processors. To achieve this purpose, it has produced guidelines which define various design requirements on components. In the area of seat valves, it is above all the standards 53-06 (compression type valves) and 85-02 (double-seat mixproof valves) that are relevant. Compliance with these design specifications is examined by an independent expert and confirmed by issuing a certificate. Almost the entire VARIVENT® and ECOVENT® valve series complies with these design specification in the standard design acc. to section 1.

If the 3-A option is selected, compliance of the valve with the requirements of the standard is confirmed by means of a sticker on the component. Consequently, if this option is selected, it is necessary to comply with the standard in terms of identification as well.

Furthermore, when this option is selected, the welds of the port connections are ground smooth. The standard does not specify that this is mandatory, but it is in line with customers’ preferences in this market.

IMPORTANT: The standard surface when this option is selected is “inside surface $R_a \leq 0.8 \mu\text{m}$, outside matte”. Many customers in this market ask for the alternative surface quality “inside surface $R_a \leq 0.8 \mu\text{m}$, outside ground”. If this is required, it must be selected separately at position 11 in the order code as a non-standard surface.

T.VIS® control top

The T.VIS® control top is an optimal system for controlling and monitoring GEA Tuchenhagen valves.

This is available in several variants depending on the valve type, tasks and user convenience.

Common features of all T.VIS® variants are:

- Flexible modular system for optimum variant configuration for the particular task (e.g. type of interface module, number of solenoid valves, etc.)
- Internal air supply for high security against failure of the main valve functions because no external air hose is required
- Characteristic design
- High Protection class (min. IP66, optional IP67 or IP69k)
- Ease of cleaning without dead zones, whatever the installation orientation
- Clear visualization of the valve status via a light dome visible 360°, which is illuminated by colored LEDs
- Low energy consumption
- Ease of handling
- Maintenance-free electronic modules
- Many special options, e.g.:
 - Air throttles
 - Cable connections, etc.

For maintenance work on the valve, the control tops can be removed from the valve actuator by loosening two bolts on the clamp, without electrical or pneumatic connections having to be disconnected.

T.VIS® concept – for valves with pneumatic actuator

T.VIS® M-15 – control top with manual sensor setting

- For open/close position feedback and actuator control
- Proven sensor technology
- Modules and solenoid valves can be retrofitted

T.VIS® A-15 – control top with automatic set-up

- For open/close position feedback and actuator control
- Automatic set-up
- Semi-automatic setup

SES – control top for potentially explosive areas

- For open/close position feedback and actuator control
- Intrinsically safe sensors and solenoid valves

INA – proximity switch holder on the actuator

- For 2 proximity switches M12x1

LAT – proximity switch holder in the lantern

- For 2 proximity switches M12x1

The certificates listed here are valid for corresponding GEA control and feedback systems. Components conforming to the requirements of the European Hygienic Engineering and Design Group (EHEDG) as well as 3-A Sanitary Standards, Inc. (3-A SSI) are available for numerous fields of applications.

Moreover, independent, standardized tests have confirmed the efficient, problem-free cleanability of numerous components – for optimum safety and economic gain.

EHEDG certificates apply only to the specific control head type as listed. However, they can be transferred to other types, owing to identical design characteristics.

Concept

The T.VIS® M-15 is equipped with manually adjustable sensors and a modular system of options, all of which form the basics of the T.VIS® feedback technology. This means it is optimally adapted to the basic requirements of the process system.

With proven sensor technology, it offers the advantages of the modern T.VIS® series in an inexpensive manner.

Standard variant

- 1 Pneumatic block
- 2 24 V DC interface module
- 3 Sensors
- 4 Solenoid valves
- 5 LED lighting
- 6 Central compressed air connection with replaceable filter
- 7 Cable gland

Features

Flexible modular system
Use of proven sensor technology
Quick and easy adjustment of the sensors
Valve status indication by LED
Various communication standards available
Components can be upgraded/converted subsequently
Filter protects solenoid valves
High-quality pneumatic fittings
Exchangeable compressed air connection
Supply and exhaust air throttles can be fitted
Standard protection class IP66

Structure

The T.VIS® M-15 is characterized by proven sensor technology. The basic equipment of the control top comprises of the 24 V DC interface module with two sensors for feedback of the valve position and three solenoid valves which can be installed subsequently, if necessary.

In the interface types with DeviceNet and AS-Interface an adapter module is connected ahead of the standard interface module, and can also be retrofitted or converted.

A replaceable filter in the supply air connection protects the solenoid valves.

Position detection

Inductive sensor system – The valve positions are detected using two manually adjustable sensors.

Setting

Mechanical – the sensors are calibrated mechanically using the positioning spindles, which are subsequently secured to prevent self-adjustment.

Concept

The T.VIS® A-15 is equipped with a high-precision path measuring system. This automatic open/close position recognition is available on any valve from GEA Tuchenhagen, along with a T.VIS® feedback system.

Development has focussed on the requirements and necessities of our customers from the fluid-processing industry. In addition to safe control and monitoring of all functions of the process valves in breweries, dairies, plants for manufacturing fruit juices as well as pharmaceuticals, the T.VIS® A-15 offers significant advantages that are directly reflected in lower total cost of ownership.

Standard variant

- 1 Pneumatic block
- 2 Control unit
- 3 Path measuring system
- 4 Solenoid valves
- 5 LED lighting
- 6 2 push buttons
- 7 Central compressed air connection with replaceable filter
- 8 M12 plug connection

Features

Quick, automatic initialization
Tamper-proof setting of tolerances
Reduced energy consumption
Reduction in operating costs
Valve status display by LED
Basic LED colors can be selected specifically for the customer
Filter protects solenoid valves
High-quality pneumatic fittings
Exchangeable compressed air connection
Supply and exhaust air throttles can be fitted
Semi-automatic setup
Standard protection class IP66

Structure

The T.VIS® A-15 is equipped with a precise path measuring system for detecting its position.

The necessary wiring for control and feedback is performed, depending on the requirements, via the M12 plug connections accessible from the outside or through direct wiring and cable glands.

The control top can be opened for this.

Operation and configuration of the T.VIS® A-15 takes place either by the two push buttons on the cap or, with the cap removed, via the buttons below. The push buttons are secured electronically against inadvertent or incorrect operation, while in operating mode.

A replaceable filter, in the supply air connection, protects the solenoid valves.

Position detection

Path measuring system – the valve position is registered by means of a highly modern path measuring system.

Setting

Automatic – following unlocking, simply pressing the two buttons on the cap of the T.VIS® A-15 starts the initialization process which runs fully automatically. There is no need to open the control top for this purpose, resulting in particularly quick, easy and safe commissioning of the control top (on average < 1 minute).

Immediately following the set-up, it is possible to set the open/close position tolerances and signal attenuation in the parameter menu.

Semi-automatic setup

As a new feature, our control top T.VIS® A-15 has the option of semi-automatic setup that permits uncomplicated exchange in the current process.

For more information about the semi-automatic setup, refer to the end of this section.

Visualization

LED display:

- Green
- Yellow
- Red

Protection class IP66

The programmable color change allows the display of colors yellow and green to be swapped over.

Service mode

Activation of the main stroke which may be required in VARIVENT® and ECOVENT® valves with open non-actuated position for valve maintenance is performed using the service mode which can be activated by the buttons. At the same time, all feedbacks are stopped (warning to the system control). Furthermore, input signals from the control room are not implemented by the T.VIS®, in order to protect the employee.

* The positions for the indication of the order code correspond to the consecutive numbering of the components for which the control and feedback systems can be selected (see selection matrix at the beginning of this section).

The code is composed as following, depending on the chosen configuration:

Position							Options								
Code	TA15														

Concept

The SES is characterized by proven sensor technology. The control top consists of an interface module, up to 2 sensors for valve position feedback and up to 3 solenoid valves which can also be installed subsequently.

The SES is only available in PA 12/L material, because conductivity of the material is required for use in ATEX/Ex areas.

- 2 Interface module
- 3 Proximity switches
- 4 Solenoid valves
- 8 Cable gland

Features

Proven NAMUR sensors
Simple and quick adjustment of sensors
Flexible modular system
Selection of various solenoid valves
Retro-fittable

Position detection

Proximity switches – the valve positions are recorded using two manually adjustable proximity switches for the non-actuated and actuated position.

Setting

Mechanical – the sensors are calibrated mechanically using the positioning spindles, which are subsequently secured to prevent adjustment.

Field of application

Use in potentially explosive atmospheres is permitted:*

- **With proximity switch** up to zone 1 and 20**
 - For connection to approved intrinsically safe equipment
 - ATEX identification:
 - II 2G Ex ia IIC T6...T1 Gb
 - II 1D Ex ia IIIC T135°C Da
- **With solenoid valve up to zone 0 and 20**
 - For connection to approved intrinsically safe equipment
 - ATEX identification:
 - II 1 GD
 - Ex ia IIC T4, T5 or T6 Ga
 - Ex ia IIIC T85°C, T100°C or T135°C Da
- **With interface module**
 - Not subject to Ex approval because it is a purely passive component

Please note

- *) There is no ATEX certification for the complete control top. Certifications can only be issued for the individual components of the control top. Please note that the permitted Ex-zone/ATEX category of the complete control top depends on the approval of the component with the lowest protection level. The entire control top with all components is optionally certified according to:
- CSA C22.2
 - ANSI/ISA 82.02.01-1999
 - UL 1203, 4th Ed.
 - UL 429, 6th Ed.
 - ISA/ANSI 12.12.01-2011
- ***) The intrinsically safe components are only allowed to be individually connected to an approved safety barrier. This arrangement permits use in a risk area.

Visualization

The position of the switch bar projecting from the control top makes it possible to detect what the position of the valve is.

Connection 0

Connection 0 can be used as an alternative to feedback systems if no feedback sensors are wanted above the actuator. Connection 0 is available in a metric and inch variant.

Technical data	
Material	1.4301 (AISI 304)
Surface	Metal blank

INA – proximity switch holder on the actuator

The proximity switch holder M12×1 (INA) makes it possible to use feedback sensors above the actuator. The proximity switch holder has prepared M12×1 holes which allow the sensors to be set optimally. A direct connection to the controller provides the feedback on the valve position.

Technical data	
Material	1.4301 (AISI 304)
Surface	Metal blank

LAT – lantern for 2 proximity switches M12×1

Feedback in the lantern is preferably used wherever control and feedback systems cannot be employed (e.g. in valves with manual actuator or two-position-stop cylinder).

Position	Description of the order code

Technical data	
Nominal switching distance	90 mm
Protection class	IP67
Operating voltage	8.2 VDC
Material	CuZn, chrome-plated / PA12-GF30
Permitted ambient temperature	–25 to 70 °C

Magnetic sensor M12x1 for pig recognition – ATEX category II 2 G, Ex zone 1	Article number
NAMUR (plug connector 514-161)	505-078

Switch bars and adapters

The following components are required for subsequent installation of a control and feedback system on a VARIVENT® valve or VARICOVER® pig retention cylinder.

If a complete control and feedback system is ordered, switch bar 221-589.80, 221-589.75 or 221-405.03 is already included. If an alternative switch bar is required, please state the corresponding article number or the component provided.

Valve type	Control top			
	T.VIS® M-15	T.VIS® A-15	T.VIS® P-15	SES
VARIVENT®	Switch bar			
Control valve type P			221-589.75	
Mixproof sampling valve type T/09	221-589.80	221-589.75		221-405.03

VARICOVER®	Switch bar/add-on parts			
Pig retention cylinder	Switch bar	221-589.80	221-589.75	-
	Adapter	221-624.03	221-624.03	-
	Mounting socket	221-589.32	221-589.32	-

Switch bar 221-589.80 for T.VIS® M-15

Switch bar 221-589.75 for T.VIS® A-15

The IP protection classes inform about the scope at which the housing of an electrical device is protected against percolation of foreign bodies (first number) and moisture (second number).

The protected systems are assigned IP-codes. The index figures represent common error options against which the system is protected. The code starts with the letters IP for "International Protection".

Meaning of the index numbers

1. Index*	Protection from foreign bodies
6	Dust-tight
2. Index*	Protection from moisture
6	Protection from powerful water jet
7	Protection from temporary immersion
9k	Protection from water at high-pressure spray down/ high pressure steam jet cleaning

* Further indices and more precise explanations can be found in the corresponding standard.

If an index number is not stated, it is replaced by the letter x (e.g. IPx6)

For the 2nd index figure (protection from moisture), the following applies:

- The protection class IPx6 includes all indices of protection class below.
- **This does not apply to the higher protection class IPx7.** If this protection class is to include a lower protection class, this is indicated by a combination of index figures (e.g. IP67/69k).

The T.VIS® control top designs of the M-15, A-15 and P-15 comply with the requirements of protection class IP66 (DIN EN 60529) as standard. Designs in the stronger protection classes IP67 or IP69k (both DIN EN 60529) are also available.

By means of the semi-automatic setup, a control top can be replaced without interrupting the current process.

For this, an employee only needs to perform the simple configuration once on site: in the version in protection class IP66 with two push buttons on the T.VIS[®] cap, and for the optional protection classes IP67 and IP69k with the cap removed right with the two buttons below.

For the semi-automatic set-up, the control top initially only learns the position of the valve disc on the non-actuated position and then remains until the valve is actuated in the scope of a running process. Only then will the end position of the valve be stored. The process thus does not need to be stopped!

The semi-automatic set-up is integrated into the T.VIS[®] A-15 as standard and does not require any additional hardware.

	Order code for air connection		In conjunction with screw fitting or plug	Use	Matching connection socket

24 V (PNP/NPN)

In 24 V parallel wiring digital signals are exchanged between a terminal unit and generally the corresponding input and output modules of a PLC. In this case, it is necessary to have a separate wire for each signal, usually in the form of a multi-core cable.

PNP (current-supplying) indicates signal transfer against reference potential L₋.

NPN (current-drawing) indicates signal transfer against reference potential L₊.

BUS AS-Interface

AS-Interface (Actuator-Sensor Interface) is a standard in fieldbus communication that was developed for connecting actuators and sensors. This is to replace parallel wiring used in the past. The AS-Interface has been an international standard acc. to EN 50295 and IEC 62026-2 since 1999. AS-i products are certified by the AS International Association, thereby, ensuring that equipment from different manufacturers will work together in the same system. The transmission medium is an unshielded, two-core yellow cable which also carries the electrical power supply (24–30 V direct current voltage) for the communication electronics and the slaves. A maximum of 62 slaves can be used per AS-i master. The slaves are addressed manually using a manual addressing unit or automatically by the master. The maximum length of the AS-i cable is 100 m, although by using repeaters it is possible to extend the entire length up to 400 m.

DeviceNet bus

DeviceNet is a CAN-based fieldbus that is chiefly used in automation engineering. DeviceNet was developed by Allen-Bradley (part of Rockwell Automation) and later transferred to the ODVA (Open DeviceNet Vendor Association) as an open standard. DeviceNet is chiefly used in the USA and, to a certain extent, Asia. A maximum of 64 network nodes can be used per fieldbus segment. The nodes address is set either using dial or DIP switches on the device, or can be configured using the bus on the basis of software. The maximum length of the DeviceNet cable depends on the selected cable type and baud rate, although it cannot exceed 500 m.

NAMUR

The 2-wire NAMUR sensors and solenoid valves used here can be operated in the Ex area because of their “intrinsically safe” ignition protection type. Using external isolating switching amplifiers, it is possible to operate control tops with this communication technology up to zone 1 or 21.

4–20 mA (3-wire)

In industrial automation engineering, the 4–20 mA current signal is the one most frequently used for analog measured value transmission. The enormously widespread use of this type of signal is explained by its ease of handling and, above all, its resistance to interference.

Using 4 mA as the initial value instead of 0 mA makes it very easy to detect and evaluate a wire break. As a rule, 4–20 mA corresponds to 0–100 % of the physical measuring range of an analog sensor or the working range of an actuator set in the parameters; the nominal value is supplied or the actual value is returned via an interface of this kind.

3-A		3-A Sanitary Standards, Inc. (3-A SSI) is an independent, non-profit corporation dedicated to advancing hygienic equipment design for the food, beverage, and pharmaceutical industries.
24/7 PMO VALVE 2.0® NON-STOP PRODUCTION		24/7 PMO VALVE® is a registered trade mark of GEA Tuchenhausen GmbH. It describes double-seat valves that have been authorized for use in PMO-regulated systems for carrying out the seat lift in order to clean the leakage chamber while the other pipeline is carrying product. This grants system operators the possibility of cleaning all valve components in contact with the product in parallel with the production process. In this way, the valves permit uninterrupted production on a 24/7 basis.
AS-i		Actuator Sensor interface. BUS system for the lowest field level.
ATEX		<i>Atmosphères Explosibles</i> . ATEX comprises the directives of the European Union in the area of explosion protection. For one thing, this is the ATEX equipment directive 2014/34/EU, for another, the ATEX workplace directive 1999/92/EC.
cCSAus		Test of a product by CSA according to applicable safety standards in Canada and the USA.
CE		<i>Conformité Européenne</i> . By affixing the CE mark, the manufacturer confirms that the product complies with the European directives 765/2008 applicable to the specific product.
CSA		Canadian Standards Association. A non-governmental Canadian organization which issues standards as well as checking and certifying the safety of products. It is now globally active.
cULus		Test of a product by UL according to applicable safety standards in Canada and the USA.
DeviceNet		BUS system of the ODVA organization for complex communication on various field levels.
EG 1935/2004		Materials in contact with the product used in valves from GEA Tuchenhausen GmbH are in accordance with EC regulation 1935/2004. This defines a general framework for materials and objects intended to come into contact with foodstuffs.
EHEDG		European Hygienic Engineering & Design Group. European supervisory authority for foodstuffs and pharmaceuticals. This authority issues approvals and certificates for products and materials that are used in the foodstuffs and pharmaceuticals industries.
FDA		Food and Drug Administration. US supervisory authority for foodstuffs and pharmaceuticals. This authority issues approvals and certificates for products and materials that are used in the foodstuffs and pharmaceuticals industries.
ODVA		ODVA is a worldwide association comprising leading automation companies. It develops network protocols and standards in the joint interests of its members, which are used for the international interoperability of production systems.
TÜV		Technischer Überwachungs-Verein. The German TÜV is a private company which carries out technical safety checks as prescribed in national legislation or regulations.
UL		Underwriters Laboratories. An organization founded in the USA for checking and certifying products and their safety.

Abbreviation	Explanation
°C	Degrees Celsius, unit of measurement for temperature
°F	Degrees Fahrenheit, unit of measurement for temperature
3-A	Standard of 3-A Sanitary Standards, Incorporated (3-A SSI)
3D	Three-dimensional
A	Ampere, unit of measurement of current intensity or Output, term used in automation
AC	Alternating Current
ADI free	All elastomer compounds are free of animal-derived ingredients
AISI	American Iron and Steel Institute, association of the American steel industry
ANSI	American National Standards Institute, American body for standardizing industrial processes
approx.	approximately
AS-i	Actuator Sensor interface, standard for fieldbus communication
ASME	American Society of Mechanical Engineers, professional association of mechanical engineers in the USA
ASME-BPE	Standard of the ASME's – bioprocessing equipment association
ATEX	<i>Atmosphères Explosibles</i> , synonymous with the directives of the European Union for potentially explosive areas
bar	Unit of measurement for pressure. All pressure values [bar/psi] refer to positive pressure [bar _g /psi _g], unless specifically stated otherwise.
bar _g	Unit of measurement for pressure relative to atmospheric pressure
CAN	Controller Area Network; asynchronous serial bus system
CE	<i>Conformité Européenne</i> , administrative symbol for the free movement of industrial products
CIP	Cleaning In Place, designates a process for cleaning technical process systems.
CRN	The Canadian Registration Number is issued by a Canadian Jurisdiction and covers pressurized components. The authorization is needed to operate these components in Canada.
CSA	Canadian Standards Association, a non-governmental Canadian Standardization organization
Cv	The Cv value corresponds to the water flow rate through a valve (in US gal / min) at a pressure differential of 1 PSI and a water temperature of 5 °C to 30 °C. kv = 14,28 Cv (USA).
Cvs	The Cv values of a valve at nominal stroke (100 % opening) is designated the Cvs value.
dB	Decibel, one tenth of a bel, named after Alexander Graham Bell and used for identifying levels and dimensions
DC	Direct Current
DIN	Deutsches Institut für Normung e. V. Standardization organization in the Federal Republic of Germany, DIN = synonym for standards issued by the organization

Abbreviation	Explanation
DIP	Dual Inline Package, design of a switch
DN	Diameter Nominal, DIN nominal width
Device Net	Network system used in the automation industry to interconnect control devices for data exchange
E	Input, term used in automation
EAC	Certification of technical conformity from the customs union of Russia/Balarus/Kazakhstan
Pressure Equipment Directive 97/23/EC	Directive of the European Parliament and the Council Directive for layout and conformity evaluation for pressure equipment and assemblies with a maximum pressure (PS) of more than 0.5 bars.
EG No. 1935/2004	Regulation of the European Parliament which lays down common rules for materials which come, or may come, into contact with food, either directly or indirectly.
EHEDG	European Hygienic Engineering and Design Group. Consortium of equipment manufacturers, food industries, research institutes as well as public health authorities
EN	European standard, rules of the European Committee for Standardization
EPDM	Ethylene propylene diene rubber, acronym acc. to DIN/ISO 1629
Ex	Synonym for ATEX
FDA	Food and Drug Administration, official foodstuffs monitoring in the United States
FEM calculation	Finite Element Method; calculation process for simulating solids
FKM	Fluorinated rubber, acronym acc. to DIN/ISO 1629
GOST	Gosudarstvennyy Standart, Certification of conformity for components according to standards and regulations of the Russian Federation
H	Henry, unit of measurement for inductance
HNBR	Hydrated acrylonitrile butadiene rubber, acronym acc. to DIN/ISO 1629
Hz	Hertz, unit of frequency named after Heinrich Hertz
I	Formula symbol for electrical current
IEC	International Electrotechnical Commission, international standardization organization for electrical and electronic engineering
IP	Ingress Protection/International Protection, index of protection class acc. to IEC 60529
IPS	Iron Pipe Size, American pipe dimension
ISA	International Society of Automation, international US organization of the automation industry
ISO	International Organization for Standardization, international organization that produced international standards, ISO = synonym for standards from the organization
kg	Kilogram, unit of measurement for weight
Kv	The Kv value corresponds to the water flow rate through a valve (in m ³ /h) at a pressure differential of 0.98 bar and a water temperature of 5 °C to 30 °C.

Abbreviation	Explanation
Kvs	The Kv values of a valve at nominal stroke (100 % opening) is designated the Kvs value
L	Conductive
LED	Light-Emitting Diode
LEFF®	Function of the T.VIS® valve informations system for cyclical pulsing during the lifting process; Low-Emission Flip Flop
mm	Millimeter, unit of measurement for length
M	Metric, system of units based on the meter or Mega, one million times a unit
m³/h	Cubic meters per hour, unit of measurement for volumetric flow
max.	Maximum
NAMUR	Standardization working association for measuring and control technology in the chemical industry, synonym for the interface type of the organization, especially for potentially explosive atmospheres
NC	Normally Closed; valve or solenoid valve control which is closed in idle status
NO	Normally Open; valve or solenoid valve control which is open in idle status
NOT-element	Logic element, NOT gate
NPN	Signal transmission against reference potential, current-consuming
NPT	National Pipe Thread, US thread standard for self-sealing pipe fittings
OD	Outside Diameter, pipe dimension
ODVA	Open DeviceNet Vendor Association, global association for network standards
PA 12/L	Polyamide
Pg	Armoured thread
PLC	Programmable Logic Controller, device for controlling a machine or system on a digital basis
PMO	Pasteurized Milk Ordinance
PN	Nominal pressure for pipeline systems according to EN 1333, rated pressure in bar at room temperature (20 °C)
PNP	Signal transmission against reference potential, current-supplying
PPO	Polyphenylene oxide, thermoplastic material
PS	Maximum permitted operating pressure at which the components can operate safely at maximum allowable temperature (TS)
psi	Unit of measurement for pressure, pound-force per square inch, 1 psi = 6894.75 Pa. All pressure values [bar/psi] refer to positive pressure [bar _g /psi _g], unless specifically stated otherwise.
psi _g	Unit of measurement for pressure relative to atmospheric pressure

Abbreviation	Explanation
PV	Solenoid valve
R _a in μm	Average roughness value, describes the roughness of a technical surface
RM	Feedback
International Protection-Code IP67, IP66, IP69K	Classifies and rates the degree of protection provided against intrusion dust, accidental contact, and water
SES	GEA Tuchenhagen control head for Ex areas, control top system of GEA Tuchenhagen
SET-UP	Self-learning installation, the SET-UP procedure carries out all necessary settings for generating messages during commissioning and maintenance.
SIP	Sterilization in Place, refers to a process for cleaning technical process systems
SMS	Svensk Mjök Standard, Scandinavian pipe dimension
SW	Indicates the size of a tool spanner, "Schlüsselweite"
TA-Luft VDI 2440	If a product is certified according to TA Luft it meets the requirements for proof of high grade performance according to TA Luft of 1.0x 10 ⁻⁴ mbar x l / (s x m) at service conditions under the VDI guideline 2440. The product will hence be tested for tightness.
TEFASEP® gold	lorum ipsum
T.VIS®	GEA Tuchenhagen valve information system, control top system from GEA Tuchenhagen
TS	Maximum permitted operating temperature
T-smart	Valve series from GEA Tuchenhagen
UL	Underwriters Laboratories, a certification organization established in the USA
USP Class VI	The United States Pharmacopeial Convention (USP) is a scientific nonprofit organization that sets standards to help protecting public health. Class VI administer tests and impacts of material and their substances on animal and human tissues.
UV	Ultraviolet, ultraviolet radiation is a wavelength of light
V	Volt, unit of measurement for voltage
VARICOMP®	Pipe expansion compensator from GEA Tuchenhagen
VMQ	High-polymer vinyl methyl polysiloxane, silicone rubber, MVQ = synonym
W	Watt, unit of measurement for power
Y	Control air connection for the working cylinder, designation from pneumatic systems
μ	Micro, one millionth of a unit
Ω	Ohm, the unit of electrical resistance named after Georg Simon Ohm

Typical application and description

You can receive two-dimensional and/or three-dimensional drawing files of our components for making your piping planning. For this purpose, please send us your specific request, stating the particular order code and the required drawing format. The required files will then be individually prepared for you.

Available drawing formats:

	Format	Name
2D formats	drw	Native Pro/E
	igs (2D)	IGS file
	dxf	AutoCAD drawing exchange
	pdf (2D)	Adobe Acrobat document
	tif	TIFF (plot)
3D formats	asm	Native Pro/E
	igs (3D)	IGS file
	pdf (3D)	Adobe Acrobat document
	stp	STP file
	bmp (3D)	Bitmap image
	jpg (3D)	JPEG image
	tif (3D)	TIFF image
	sat	Standard ACIS

Please note

All our sales and/or services are exclusively subject to our valid terms and conditions of sale and/or service applicable in the respective country of business, which can be found on our internet platform: www.gea.com.

If not available or if you otherwise wish to receive such terms and conditions directly from us, please contact us and we of course will send you the applicable version of our terms and conditions for the envisaged business.

We live our values.

Excellence • Passion • Integrity • Responsibility • GEA-versity

GEA is a global technology company with multi-billion euro sales operations in more than 50 countries. Founded in 1881 the company is one of the largest providers of innovative equipment and process technology. GEA is listed in the STOXX® Europe 600 Index. In addition, the company is included in selected MSCI Global Sustainability Indexes.
